This text is a summary of items that required qualification as a result of data validation of the Kenvil data. The following acronyms were used in the text:

CCAL - continuing calibration
LCS - laboratory control sample
%D - percent difference
'U' - undetected qualification
'J' - estimated concentration
'R' - rejected qualification
MS - matrix spike
MSD - matrix spike duplicate
'UJ' - undetected at an estimated concentration
SDG - sample delivery group
PCB - polychlorinated biphenyl
TPH - total petroleum hydrocarbon
%R - percent recovery
%RSD – percent relative standard deviation
%RPD – relative percent difference

Samples were not qualified if the temperature was below the recommended temperature of $4 \pm 2^\circ \text{C}$, but were qualified for elevated cooler temperature for the Explosives and Energetics fraction, where indicated in the data summaries below.

The following methods were used by the laboratory:

- Metals using method 6010B,
- Mercury using method 7471A,
- Nitroglycerin using method 8330,
- Nitrocellulose using method IAAP8,
- PCBs in water using method 8082,
- Explosives and Energetics using method 8330,
- Semivolatile organics using method 8270C,
- Volatile organics using method 8260B

The laboratory analyzed Explosives/Energetics using EPA method 8330. There were a few differences between quality control requirements in method 8330 and those defined in the Region II SOP. The differences are described below, and did not warrant qualification.

- Initial Calibration - RII lists analyzing the standards in triplicate. The current version of SW846 Method 8330 does not require the triplicate analysis of the initial calibration, and the laboratory does not run the standards in triplicate. The laboratory noted an older draft version of SW846 Method 8330 contained the triplicate requirement, which was omitted when promulgated into update III.

- Special QC - this is a solvent blank that is assumed for the mobile phase only, which the laboratory doesn't typically run. The laboratory relies on the method blank as a check for instrument cleanliness as well as extraction cleanliness. Should there be a problem with a blank, the laboratory noted they would check their reagents, including mobile phase, to make sure the instrument is clean. This typically is not an issue according to the laboratory.
- Lab Duplicate – the laboratory analyzes either an MS/MSD pair or an LCS/LCSD pair for precision measurement, instead of specific sample duplicates.
- Primary versus confirmation criteria - the laboratory notes the data between the two runs is not handled like their other dual column analyses. The second column, which is used for confirmation is not as good as the primary in that there are 5 coeluting pairs of compounds. The laboratory always reports the primary data with the confirmation data for support.

SDG KVL53

Sample Receipt and Custody Documentation - No problems were noted.

Semivolatiles – Sample SB-R-M9-01(4-4.5) was qualified as estimated for all compounds in the sample due to low surrogate recovery. All compounds with the exception of 2,4-dinitrotoluene, benzo(b)fluoranthene, benzo(k)fluoranthene and indeno(1,2,3-cd)pyrene were qualified as estimated due to unacceptable matrix spike recovery. Only the parent sample was qualified. Compound benzo(b)fluoranthene was qualified as estimated for samples SB-R-M9-09(.5-1), SB-R-M9-02(.17-.67), SB-R-M9-09(4-4.5), SB-R-M9-04(1.5-2) and SB-R-M9-03(4-4.5) due to continuing calibration criteria of 25% exceedance.

Explosives/ Nitroglycerin –. No qualification was made.

Nitrocellulose – Sample SB-R-M8-02(1.5-2) was qualified as estimated due to zero percent matrix spike recovery. The parent sample was qualified.

Metals – All samples were qualified as estimated for zinc due to serial dilution exceedance. All lead values were qualified as estimated since the laboratory noted interference was present. All antimony results were qualified as estimated due to low LCS and matrix spike/matrix spike duplicate recovery. Sample SB-R-M8-02(1.5-2) was qualified as estimated for selenium due to low recovery of the low level check standard. Samples SB-R-M8-04(5-5.5), SB-R-M8-04(2-2.5), SB-R-M8-02(4.5-5), SB-R-M8-02(.5-1) and SB-R-M8-01(4.5-5) were qualified as estimated for arsenic due to low recovery of the low level check standard. All lead samples were qualified as estimated due to elevated matrix spike recovery. All zinc results were qualified as estimated due to low matrix spike recovery.

Other Comments – none.

SDG KVL59

Sample Receipt and Custody Documentation - The cooler temperatures ranged from 1.8 – 4.4 °C which is slightly outside the recommended limits of 4 ± 2 °C. No action was taken and sample integrity was considered maintained. Sample SB-R-L11-02(0.5-1.0) was originally reported with nitroglycerin as undetected. The raw data indicated there was an estimated concentration detected. The laboratory was contacted and the result was revised to reflect the estimated value (4800 J).

Volatiles - No qualification was made.

Semivolatiles – No qualification was made.

PCBs – No qualification was made.

Explosives – No qualification was made.

Nitrocellulose – The matrix spike and spike duplicate recoveries were zero, resulting in estimated qualification of nitrocellulose in the parent sample: SB-R-K11-03(4-4.5).

Metals – All soil samples were qualified as estimated for silver and thallium due to low recovery of the low level check standard. The following nitroglycerin samples were qualified with a 'B' to indicate associated preparation blank contamination (<5x) for mercury: SB-R-K11-03(4-4.5), SB-R-K11-03(4-4.5)DUP, SB-R-K10-01(.5-1.0), SB-R-K10-01(5.5-6.0), SB-R-L10-02(5-5.5), SB-R-L10-02(0.5-1.0), SB-R-L10-01(0.25-0.75), SB-R-L11-02(6.5-7.0), SB-R-L11-02(0.5-1.0), SB-R-L10-01(1.5-2.0), SB-R-K11-04(2-2.5).

SDG KVL62

Sample Receipt and Custody Documentation - The laboratory recorded cooler temperatures from 1.6 to 7.3° C. Explosives samples associated with the coolers exceeding 4.9° C were qualified as estimated.

Volatiles - No qualification was made.

Semivolatiles – Due to high MS/MSD %R for sample SB-R-M10-01(0.5-1.0), compounds benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(a)pyrene, and indeno(1,2,3-cd) pyrene were qualified as estimated.

PCBs – The target %D for CCALs were greater than 15%. The laboratory used the average %D, which met the criteria. No qualification was made.

Explosives/ Nitroglycerin –The CCAL criterion for 2,4,6-trinitrotoluene (19.7%) exceeded 15% for standard ICNTXDF (file 1E12100.12R). The laboratory read the compound from the confirmation run. No action was taken. The surrogate %R (1,166%) for sample SB-R-N9-01(0.5-1.0) was out of limits (67-154) due to matrix interference. All compounds were nondetect, therefore no qualifiers were added. Compounds eluted out of retention time windows for several CCAL standards in sequence 1C12100. The %D for each compound was within limits. No action was taken for retention windows alone. For run 1C12093 (the confirmation run for 1E12093), %RSDs for the ICAL standard exceeded the 20% criterion for the surrogate compound and 2,4,6-trinitrotoluene. The laboratory reads from the primary run, therefore no action was taken.

Metals – All antimony (Sb) results were qualified as estimated for all samples due to low MS/MSD %R. Arsenic results were qualified as estimated for samples SB-R-K9-01(1.0-1.5), SB-R-L9-01(1.0-1.5), SB-R-M9-01(0.5-1.0), and SB-R-N9-01(5.08-5.58) due to preparation blank contamination.

This text is a summary of items that required qualification as a result of data validation of the Kenvil data. The following acronyms were used in the text:

CCAL - continuing calibration
LCS - laboratory control sample
%D - percent difference
'U' - undetected qualification
'J' - estimated concentration
'R' - rejected qualification
MS - matrix spike
MSD - matrix spike duplicate
'UJ' - undetected at an estimated concentration
SDG - sample delivery group
PCB - polychlorinated biphenyl
TPH - total petroleum hydrocarbon
%R - percent recovery
%RSD – percent relative standard deviation
%RPD – relative percent difference

Samples were not qualified if the temperature was below the recommended temperature of $4 \pm 2^{\circ}\text{C}$, but were qualified for elevated cooler temperature for the Explosives and Energetics fraction, where indicated in the data summaries below.

Twenty-four soil samples were validated in this dataset. Lancaster Laboratories Inc. (LLI) in Lancaster, Pennsylvania analyzed the samples for semivolatiles and energetics/explosives with the exception of diazodinitrophenol, which was subcontracted to GPL Laboratory in Fredrick, Maryland.

The following methods were used by the laboratories:

- Semivolatile Organics using method 8270C,
- Explosives/Energetics using EPA method 8330,
- Nitrocellulose using method IAAP 1983,
- Diazodinitrophenol using EPA method 8330A modified.

The laboratory analyzed Explosives/Energetics using EPA method 8330. There were a few differences between quality control requirements in method 8330 and those defined in the Region II SOP. The differences are described below, and did not warrant qualification.

- Initial Calibration - RII lists analyzing the standards in triplicate. The current version of SW846 Method 8330 does not require the triplicate analysis of the initial calibration, and the laboratory does not run the standards in triplicate. The laboratory noted an older draft version of SW846 Method 8330 contained the triplicate requirement, which was omitted when promulgated into update III.

- Special QC - this is a solvent blank that is assumed for the mobil phase only, which the laboratory doesn't typically run. The laboratory relies on the method blank as a check for instrument cleanliness as well as extraction cleanliness. Should there be a problem with a blank, the laboratory noted they would check their reagents, including mobile phase, to make sure the instrument is clean. This typically is not an issue according to the laboratory.
- Lab Duplicate – the laboratory analyzes either an MS/MSD pair or an LCS/LCSD pair for precision measurement, instead of specific sample duplicates.
- Primary versus confirmation criteria - the laboratory notes the data between the two runs in not handled like their other dual column analyses. The second column, which is used for confirmation is not as good as the primary in that there are 5 coeluting pairs of compounds. The laboratory always reports the primary data with the confirmation data for support.
