TABLE OF CONTENTS

1.0	INTRODUCTION.....	1-1
1.1.	RI OBJECTIVES	1-2
1.2.	REPORT ORGANIZATION	1-3
2.0	SCOPE OF WORK.....	2-1
2.1.	UTILITY CLEARANCE	2-2
2.2.	HEALTH AND SAFETY FIELD SCREENING FOR E&E CONSTITUENTS	2-2
2.3.	AIR MONITORING FOR VOCS	2-3
2.4.	SOIL SAMPLING.....	2-4
2.4.1	AOC-Based Soil Sampling Strategy.....	2-7
2.4.1.1.	Area I AOC-Based Soil Sampling.....	2-7
2.4.1.2.	Vertical Sample Collection at SI AOC-Based Locations	2-8
2.4.1.3.	Soil Sampling at SI AOCs Reserved for the RI.....	2-8
2.4.2	Site-Wide Grid-Based Soil Sampling Strategy.....	2-10
2.4.3	Hydraulic Oil Trench Investigation.....	2-11
2.4.4	Recently Identified AOCs Not Previously Investigated	2-12
2.4.5	Sample Locations Proposed But Not Sampled	2-13
2.5.	SAMPLE IDENTIFICATION	2-13
2.5.1	Soil Boring Sample Identification	2-14
2.5.2	Test Pit Sample Identification	2-15
2.5.3	Soil Hydraulic Oil Pipeline Trench Sample Identification	2-16
2.5.4	Non-Sample-Specific Locations for Field or Laboratory QA/QC Identification	2-17
2.6.	LABORATORY ANALYSIS	2-18
3.0	DATA QUALITY CONTROL	3-1
3.1.	PRECISION AND ACCURACY	3-2
3.1.1	Matrix Spikes/Matrix Spike Duplicate	3-2
3.1.2	Laboratory Duplicates	3-2
3.1.3	Laboratory Control Samples.....	3-3
3.1.4	Surrogate Recoveries.....	3-3
3.1.5	Calibration.....	3-3
3.2.	REPRESENTATIVENESS.....	3-4
3.3.	COMPLETENESS	3-4
3.4.	COMPARABILITY	3-6
3.5.	SUMMARY OF DATA QUALITY AND RELIABILITY	3-6
3.6.	DATA QUALITY OBJECTIVES.....	3-6
4.0	REGIONAL AND SITE SPECIFIC GEOLOGY AND HYDROGEOLOGY	4-1
5.0	RESULTS	5-1
5.1.	SELECTION OF COMPARISON CRITERIA	5-3
5.1.1	Soil Quality Standards	5-3
5.2.	FREQUENT EXCEEDANCE CONSTITUENTS.....	5-4
5.3.	ORGANIZATION OF RESULTS	5-9

TABLE OF CONTENTS (Continued)

5.4.	GEOSTATISTICAL MODELING AND CRITERIA CONTOURING METHODOLOGY FOR FEC AND AREAL EXTENT FIGURES.....	5-12
5.4.1	Geostatistical Modeling for FEC Figures	5-12
5.4.2	Criteria Contouring for FEC Figures.....	5-14
5.4.3	Criteria Contouring For Areal Extent Figures	5-15
5.4.4	Horizontal Limit Determination	5-16
5.5.	HISTORIC FILL DISCUSSION.....	5-17
5.5.1	Historic Fill Investigation	5-19
5.5.2	Historic Fill Distribution	5-20
5.5.3	Summary.....	5-21
5.6.	AREA I ANALYTICAL RESULTS.....	5-22
5.6.1	AOCs Reserved for the RI.....	5-27
5.6.2	Discussion of Analytical Results	5-27
5.6.3	Hydraulic Oil Pipeline Investigation	5-33
5.6.4	Recently Identified AOCs Not Previously Investigated	5-34
5.6.5	Area I Summary	5-34
5.7.	AREA II ANALYTICAL RESULTS	5-35
5.7.1	AOCs Reserved for the RI.....	5-40
5.7.2	Discussion of Analytical Results	5-41
5.7.3	Area II Summary	5-45
5.8.	AREA III ANALYTICAL RESULTS	5-46
5.8.1	AOCs Reserved for the RI.....	5-52
5.8.2	Discussion of Analytical Results	5-52
5.8.3	Hydraulic Oil Pipeline Investigation	5-56
5.8.4	Recently Identified AOCs Not Previously Investigated	5-57
5.8.5	Area III Summary	5-57
6.0	CONCLUSIONS	6-1
6.1.	SOIL RI SPECIFIC CONCLUSIONS	6-1
6.1.1	Quality Assurance/Quality Control	6-1
6.1.2	Historic Fill.....	6-2
6.1.3	Historical Redevelopment, Reworking and Decontamination.....	6-3
6.1.4	Analytical Results.....	6-3
6.2.	GENERAL CONCLUSION.....	6-5

1.0 INTRODUCTION

Hercules Incorporated (Hercules) retained MWH Americas, Inc. (MWH) to conduct a Remedial Investigation (RI) at the Kenvil Works Facility (Facility), located in Kenvil, New Jersey, as part of its obligation to execute a Remedial Agreement (RA) with the New Jersey Department of Environmental Protection (NJDEP). The RA was signed on March 10, 1995 and established the basis for conducting activities at the Facility under New Jersey's Industrial Site Recovery Act (ISRA).

This section of the Kenvil RI Report (RIR) is Volume B and presents the soil portion of the RI. This soil volume of the RIR expands on the Soils Site Investigation (Soils-SI), which was completed in 2004 (MWH, 2004) and approved by NJDEP in 2005 (Appendix A). The approach and organization of this RIR complies with requested variances to the New Jersey Administrative Code (N.J.A.C.) 7:26E Technical Requirements for Site Remediation (TRSR), with concurrence of the NJDEP Case Management team through the use of the triad approach. Variances were discussed in routinely scheduled triad approach meetings and teleconferences held to discuss the development, submission, and subsequent review of the RIR. Triad approach meetings/teleconferences were attended by the NJDEP, Hercules, and Hercules' consultants and documented in written meeting minute notes which are presented in Volume A of the RIR.

In addition to the findings of the Soils-SI, professional judgment based on extensive historic Explosive and Energetic (E&E) manufacturing operations was considered throughout site investigation activities. Key personnel consulted included Harry Pascoe (Facility Historian and former Employee), Karl Broton (former Facility Employee), Peter Braxton (former Facility Employee and Area Manager), Raymond Hunt (former Facility Safety and Environmental Manager), James Bevis (present Facility Manager), and Edward Meeks (Energetic Materials Specialist).

The RIR is presented in five volumes because of the comprehensive coverage of the RI effort and the volume of the acquired analytical data. The intent of this soil volume is to provide a comprehensive stand-alone document focusing on a single media of concern to facilitate review of the RIR. However, to truly make the soil volume an independent

document, it would have required a duplication of information that is more effectively presented in other volumes of this RIR. Therefore, from time to time, the reviewer may find it necessary to refer to other volumes of this RIR.

The RIR is organized into the following volumes:

- Volume A – RI Summary Document. This volume of the report presents RI objectives, brief summary of scope of work, data quality control objectives, brief summary of regional and site-specific geologic and hydrogeologic conditions, site conceptual model, ecological receptor analysis, brief summary of results, and conclusions and recommendations;
- Volume B – Soil remedial investigation;
- Volume C – Groundwater remedial investigation;
- Volume D – Sediment remedial investigation; and,
- Volume E – Surface Water remedial investigation.

This volume describes the results and interpretation of soil RI activities conducted at the Facility. This volume is designed to comply with the intent of the TRSR for reporting remedial investigation activities (N.J.A.C. 7:26E-4.8), derived from the implementation of the NJDEP approved Area I Remedial Investigation Work Plan (Area I RIWP, MWH, 2005) that was later replaced by the Revised Site-Wide Remedial Investigation Work Plan (Revised Site-Wide RIWP) (MWH, 2006). The purpose of revising/replacing the Area I RIWP was to incorporate Areas II and III and evaluate the Facility on a site-wide basis to streamline the investigation process and expedite restoration activities. In addition to the Revised Site-Wide RIWP, numerous verbal communications between Hercules and the former NJDEP Case Manager (Mr. Paul Harvey) using the triad approach evaluated the progress of the RI and served as a mechanism to refine field activities.

1.1. RI OBJECTIVES

The objectives of the RI as described in N.J.A.C. 7:26E-4.1 are to determine the following:

- Delineate the horizontal and vertical extent of contamination in all media;
- Determine the general surface and subsurface characteristics of the Facility;
- Identify the migration paths and actual or potential receptors of contaminants;
- Collect and evaluate the data necessary to evaluate remedial action alternatives;
- Collect the data necessary to evaluate actual and potential ecological impacts;
- Collect data necessary to develop permit limitations for any discharge to environmental media; and,
- Identify containment and/or stabilization activities to prevent contaminant exposure to on-site receptors and to prevent off-site migration of contaminants while remedial alternatives are being evaluated.

1.2. REPORT ORGANIZATION

This soil volume is further organized as follows:

- Section 1 presents the RI objectives and organization of this volume;
- Section 2 presents a detailed description of field and laboratory activities conducted in support of the soil remedial investigation;
- Section 3 presents the data quality control discussion;
- Section 4 presents regional and site specific geology and hydrogeology;
- Section 5 presents analytical results and findings for soil; and,
- Section 6 presents conclusions for the soil remedial investigation.

2.0 SCOPE OF WORK

The following sections summarize the field sampling scope of work and laboratory analyses for soil samples collected during the RI. The scope of work implemented in the RI was specified originally in the Area I RIWP that was replaced by the Revised Site-Wide RIWP. In addition, modifications or refinements made to field activities through the use of the triad approach are included in this section. The scope of work was developed in accordance with the TRSR (N.J.A.C. 7:26E-4.5) and the New Jersey Field Sampling Procedures Manual (FSPM, August 2005). The scope of work for RI soil sampling included the following activities:

- Utility clearance prior to invasive subsurface field activities;
- Health and safety field screening for E&E constituents;
- Air monitoring for Volatile Organic Constituents (VOCs);
- Collection of 1,287 horizontal and vertical delineation soil samples from 603 sample locations for laboratory analysis (Figure B-1) to define the nature and extent of constituents present at concentrations exceeding the applicable soil cleanup criteria; and,
- Collection of 8 soil samples from 8 sample locations at 7 trenches located within areas believed to use hydraulically operated equipment to determine if historic releases occurred (Figure B-1).

The scope of work was conducted in the following areas of the Facility during a single phase of investigation (Figure B-1):

Area I – RI, areas north and east of Powder Mill Road (B-Line, Finishing, Storage, eastern portions of Development, and portions of Miscellaneous/Offsite former operational areas).

Area II – RI, areas south and west of Mule Barn Road (Nitroglycerin (NG), Pentaerythritol Tetranitrate (PETN), TNT, Dynamite, and portions of Miscellaneous/Offsite former operational areas).

Area III – RI, central portions of the Facility (A-Line, Maintenance, Ammonia-Nitrate (AN), Diazo, Western Development, and portions of Miscellaneous/Offsite former operational areas).

Detailed descriptions of field tasks are provided in the Area I RIWP and the Revised Site-Wide RIWP. Sample handling, quality assurance/quality control (QA/QC) procedures, and analytical methodologies are provided in the Final Analytical Quality Assurance Project Plan (AQAPP, MWH, 2006). Field procedures and methodologies are provided in the Final Field Quality Assurance Project Plan (FQAPP, MWH, 2006). Health and safety protocols are provided in the Site Specific Health and Safety Plan (SSHSP, MWH, 2005).

Field analysis utilizing immunoassay (IA) and X-Ray Fluorescence (XRF) real-time data measurement methods were not performed during the RI. Following verbal discussions with the NJDEP and finalization of the Revised Site-Wide RIWP, it was determined that all samples would be submitted to a NJDEP certified laboratory.

The active firing range, which includes a single trap field and handgun range, was not included in the scope of this investigation. The active firing range, located in Grids N13 and O13, is a recreational area and is used by the Hercules Sportsman's Club, Roxbury Township Police, and Mount Olive Police. Activities performed at the active firing range are not associated in any manner with the commercial operations performed at the Facility. There is no present intention of ceasing recreational firearm use at the active firing range.

2.1. UTILITY CLEARANCE

Prior to conducting invasive subsurface field activities, MWH coordinated with Hercules personnel to determine the location of underground utilities in the areas where intrusive field investigation activities took place. The Facility base map and other available historic maps detailing utility locations were utilized.

2.2. HEALTH AND SAFETY FIELD SCREENING FOR E&E CONSTITUENTS

Soil samples were visually inspected and field screened with an EX-PRAY™ colorimetric E&E detection test kit for the presence of E&E constituents prior to

initiating sampling activities, to ensure the safety of field and laboratory personnel. If E&E constituents were visually identified at any time during the sampling event, the project energetic materials specialist was notified and personally inspected the area. The energetic materials specialist determined if the concentration of E&E constituents was significant and if the sampling activities could be safely conducted. Upon sample collection, a representative aliquot of the sample was field screened with the EX-PRAY™ test kit. If E&E constituents were detected, the lab was notified of the presence of E&E constituents and anticipated concentrations to ensure the samples were handled properly.

The EX-PRAY™ E&E constituent detection test kit is an aerosol based technique that utilizes a patented paper and colorimetric reaction to identify E&E constituents down to residual levels. This kit can differentiate between polynitro-aromatics (2,4,6-Trinitrotoluene (TNT), picric acid, etc.), nitrate esters (nitroglycerin (NG), nitrocellulose (NC), etc.), and nitramines (Hexahydro-1,3,5-Trinitro-1,3,5-Triazine (RDX), Octahydro-1,3,5,7-Tetranitro-1,3,5,7-Tetrazocine (HMX), etc.). The EX-PRAY™ kit, however, does not provide conclusive contaminant concentration data; it is designed only to determine if E&E constituents are present in ranges from residual levels to near percentage concentrations. However, a trained sampler with sufficient experience can broadly estimate anticipated concentration ranges. The manufacturers' information and instructions for performing the EX-PRAY™ tests are included in Appendix A of the FQAPP.

There were no instances where E&E constituents warranted a modification of the soil sampling program.

2.3. AIR MONITORING FOR VOCs

Field screening for the presence of VOCs was conducted continuously during the collection and handling of soil samples for the purpose of health and safety screening in the breathing zone and to bias sample collection to the interval with the highest probability of VOCs present above applicable soil cleanup criteria. The field screening was performed with a photo-ionization detector (PID, Mini Ray 2000) using a standard

10.6 electron volt lamp. Section 5.2 of the FQAPP (MWH 2006) presents the VOC screening procedure.

2.4. SOIL SAMPLING

Results from the analyses performed on soil samples collected in both the SI and RI are presented in this volume of the RIR. A total of 2,014 soil samples were collected from 2,011 soil sample locations during the SI (per N.J.A.C. 7:26E-3.6). This total number of samples includes samples collected during the Soils – SI (1,985) in addition to 29 sediment samples that were collected during the Surface Water/Sediment (SW/SD) – SI (MWH, 2004) (Refer to note at the end of this section). A total of 1,295 soil samples were collected from 611 soil sample locations during the RI (per N.J.A.C. 7:26E-4.1(b)). Figure B-1 presents the RI and SI soil sample locations. This section presents the soil sampling procedures used during implementation of the RI. The SI soil sampling procedures are described in the Soils – SI (Appendix A).

The soil sampling approach used in the SI focused toward individual areas of concern (AOCs). The RI soil sampling effort focused primarily on site-wide soil quality using a grid-based sampling approach to define the nature and extent of constituents present at concentrations exceeding the applicable soil cleanup criteria identified in the SI. In addition to site-wide soil quality, the RI also evaluated AOCs that during implementation of the SI were determined through either pre-existing data or professional judgment that various constituents would exceed applicable soil cleanup criteria. RI soil sampling efforts also evaluated the potential of releases from historic hydraulic oil pipelines that supported smokeless powder manufacturing.

Soil samples were collected during the RI to establish the horizontal extent of surficial constituents detected at concentrations exceeding the applicable soil cleanup criteria per N.J.A.C. 7:26E-3.6(a)5. These samples were collected from a 6-inch (in.) interval from zero to 2.0-feet (ft.) below the ground surface (bgs) biased to the interval with the highest potential environmental concern. One horizontal delineation sample was collected from each sample location. The sample was field screened for the presence of VOCs and

E&E, and visually observed for evidence of an environmental concern (e.g., discoloration, odor, etc.) using professional judgment.

Soil samples were collected during the RI to establish the vertical extent of constituents detected at concentrations exceeding the applicable soil cleanup criteria, per N.J.A.C. 7:26E-3.6(a)6. These samples were collected from the first 6-in. interval of native soils encountered. Up to three vertical delineation samples were collected from each sample location depending on number of discrete soil layers observed. The samples were field screened for the presence of VOCs and E&E, and visually examined for evidence of an environmental concern (i.e., discoloration, odor, etc.) using professional judgment. If evidence of a potential environmental concern was observed, the first 6-in. interval below the potential environmental concern was sampled.

Soil samples were collected during the RI by a variety of sampling methods including direct push (Geoprobe™) methods, test pit excavations, soil coring, and hand augering. A description of the sampling methods used during the RI sampling efforts is provided in Section 7.0 of the FQAPP.

All soil samples collected in the RI except those collected for VOC analysis were homogenized in disposable aluminum pans prior to placement in laboratory provided bottleware. VOC samples were collected prior to homogenization from undisturbed soil contained in the sample collection device (i.e., Geoprobe™ macrocore, soil coring device, excavator bucket, etc.). An 8 to 12 gram (g) aliquot of soil was collected using a laboratory provided plastic soil sampling syringe and transferred into a methanol-preserved vial, following the methanol-preservation procedures provided in the NJDEP's Methodology for the Field Extraction/Preservation of Soil Samples With Methanol For Volatile Organic Compounds (February, 1997). Detailed field procedures are provided in Section 16.0 of the FQAPP.

After sample collection, the soil was visually logged and results of field screening for VOCs and E&E were noted on the boring logs. The boring logs are provided in Appendix B. If the sample was collected via the test pit sample collection method, a photograph was taken of the excavation. Appendix C presents the photolog for samples

collected via test pit excavations. Photographs for a portion of samples collected via test pit excavations were of poor quality or the camera malfunctioned and are not included in Appendix C.

All soil locations were surveyed in the field using a Trimble™ global positioning system (GPS) with sub-meter accuracy.

The methodology and procedures discussed above were utilized to collect all RI soil samples unless indicated otherwise in the sections below.

Note – The Soils-SI incorrectly indicated 1,998 samples were collected during the SI. The correct number of samples collected and submitted for laboratory analysis was 1,985. The total number of SI samples and locations referenced in this text encompasses samples collected during the Soils – SI (1,985) in addition to 29 sediment samples that were collected during the Surface Water/Sediment (SW/SD) – SI (MWH, 2004), resulting in a total of 2,014 samples. These 29 sediment samples were collected in stream segments, ponds, wet areas, or former ditches that no longer convey water. Following cessation of manufacturing operations and the subsequent demolition efforts, greater than 1,000,000 square (sq.) ft. of impervious foundations, walkways, and driveways were removed. The removal of the impervious surfaces greatly increased the natural infiltration of precipitation, and therefore significantly reduced or eliminated surface water runoff in some areas, causing segments of former drainage areas to become dry and no longer contain sediment. Samples collected from these areas are not included in Volume D – Sediment. They are included in this volume as these areas are no longer submerged and are now defined as soils. The following SI sediment sample locations were redefined as soils.

Remedial Area	Former Operational Area	Sample ID	Remedial Area	Former Operational Area	Sample ID

2.4.1 AOC-Based Soil Sampling Strategy

Before being replaced by the grid-based soil sampling strategy, the AOC-based soil sampling strategy was developed for the Area I RIWP. The Area I RIWP was followed for the Area I AOC-based soil samples. The general strategy was followed for soil sampling at SI AOCs reserved for the RI and vertical sample collection at SI AOC-based locations. However, the Revised Site-Wide RIWP was maintained to determine the vertical delineation sampling frequency. The following sections provide details of the scope and rationale of the AOC-based soil sampling performed during the RI.

2.4.1.1. Area I AOC-Based Soil Sampling

Limited RI samples were collected in Area I using the AOC-based approach. These samples were collected prior to the change in sampling strategy from the AOC-based sampling strategy to the grid-based sampling strategy. A total of 19 horizontal and vertical delineation samples were collected from 10 locations with an average depth of 2.9-ft bgs and a maximum depth interval of 5.0 to 5.5-ft bgs (Figure B-1). Soil samples were collected at 100-ft. intervals from select AOCs.

Up to three soil samples were collected at each location for laboratory analysis. The first sample was utilized to establish the horizontal extent of constituents detected at concentrations exceeding the applicable soil cleanup criteria. The remaining samples were utilized to establish the vertical extent of constituents detected at concentrations exceeding the applicable soil cleanup criteria. At each location, samples were analyzed for the analytical groups identified during the Soils-SI with applicable soil cleanup

criteria (Table B1-2). Table B2-2 presents the sampling and analysis plan for Area I AOC-based soil samples.

Soil boring logs are presented in Appendix B.

2.4.1.2. Vertical Sample Collection at SI AOC-Based Locations

During the RI, vertical delineation samples were collected via the test pit sampling method at select SI AOC-based locations where SI samples collected at depths greater than 2-ft. bgs indicated applicable soil residential cleanup criteria exceedances. A total of seven vertical delineation samples were collected at seven locations with an average depth of 7.6-ft. bgs and a maximum depth interval of 13.0 to 13.5-ft. bgs (Tables B2-2, B3-2, and B4-2) (Figure B-1). At each location, the samples were analyzed for the analytical groups identified during the Soils-SI with applicable soil residential cleanup exceedances (Table B1-2).

Soil boring logs are presented in Appendix B. Soil boring photographic logs are presented in Appendix C.

2.4.1.3. Soil Sampling at SI AOCs Reserved for the RI

Forty-three AOCs were reserved for the RI during the SI based on existing analytical data or if field observations (made during the SI) indicated that various constituents would likely exceed the applicable residential soil cleanup criteria. During the RIWP development process, one additional AOC (M5-3, Old Burning Ground) was added to this list (although sampled at the time of the SI, additional sampling was needed to define the horizontal and vertical extent of this AOC). All 44 AOCs are presented on Figure B-46 and Tables B2-1, B3-1, B4-1, and B5-1. From these AOCs, a total of 485 horizontal and vertical delineation samples were collected from 208 locations (Figure B-1) with an average depth of 5.7-ft. bgs and a maximum depth interval of 20.5 to 21-ft. bgs during the RI.

Exploratory Borings - Prior to sample collection from the four largest AOCs (B13-2, M5-3, M8-1, and N6-1), exploratory visual observation soil borings were advanced

around the perimeters to better define the actual boundaries of the AOCs. The initial perimeters of these AOCs were estimated during the SI and were based on historical site maps, topography, and professional judgment. Borings were placed at 100-ft. intervals along the anticipated perimeter of each of the four AOCs. A total of 80 borings were advanced to a maximum depth of 8-ft. bgs. No analytical samples were collected, but these soil borings were visually inspected and classified. Soil boring logs are provided in Appendix B.

Analytical Sampling - Soil sample locations were placed at the boundaries and center of each AOC reserved for the RI. Up to three soil samples were collected at each location for laboratory analysis. The first sample at each location was utilized to establish the horizontal extent of constituents detected at concentrations exceeding the applicable soil cleanup criteria. The remaining samples were utilized to establish the vertical extent of constituents detected at concentrations exceeding the applicable soil cleanup criteria. If field screening and professional judgment indicated that significant quantities of E&E were present, samples were not collected directly from the interval with the highest potential of environmental concern. In these cases, samples were collected directly below the interval due to health and safety concerns. This practice was used in a limited number of AOCs predominantly located in the TNT Area and western Dynamite Area.

Soil samples from the 44 AOCs were analyzed for the analytical groups identified during the Soils-SI with applicable soil residential cleanup criteria exceedances (Tables B1-2, B2-2, B3-2, and B4-2) with the exception of two AOCs. Samples from AOCs H8-1 and H8-584 were submitted for Priority Pollutant +40 (PP+40) list of Semi-volatile organic constituents (SVOCs) and E&E constituents, including Diazodinitrophenol (DDNP) analysis (Table B1-3). The analytical requirements for these AOCs were based on the analytical results of an exploratory sample collected during the SI. The results of the exploratory sample indicated that analysis of additional SVOCs and E&E constituents, beyond the RI analytical requirements, were necessary to complete characterization of these AOCs. These two AOCs are located within the same area and were sampled simultaneously; therefore analytical samples collected from both of these AOCs are designated as H8-1.

In the event field observations indicated the presence of an analytical group within a sample interval which was not specified in the SI, the analytical group was added to the analytical requirements for that sample. For example, if 2,4/2,6-DNT was observed via field screening then the SVOC analytical group, which includes 2,4/2,6-DNT, was added. Samples where an analytical group was added due to field observations are presented in Tables B2-1, B3-1, B4-1, and B5-1.

Soil boring logs are presented in Appendix B. Soil boring photographic logs are presented in Appendix C.

2.4.2 Site-Wide Grid-Based Soil Sampling Strategy

The majority of the RI samples were collected using a grid-based approach (Revised Site-Wide RIWP). A total of 776 horizontal and vertical delineation samples were collected from 385 locations with an average depth of 2.8-ft. bgs and a maximum depth interval of 9.5 to 10-ft. bgs using the grid-based sampling approach during the RI (Tables B2-2, B3-2, and B4-2) (Figure B-1). Soil sample locations were placed at a frequency of every 250-ft. The proposed sample locations were located in the field using a Trimble™ GPS with sub-meter accuracy. Sample locations were biased towards areas with higher potential of environmental concern in the vicinity of the proposed locations, such as former ditches, former testing ground, topographically low spots, or where surficial environmental concerns were visible (i.e., discoloration, stressed vegetation, etc.). The actual sample locations were typically within 10-ft. of the proposed locations; the actual coordinates were recorded using GPS once the field location was determined.

Up to three soil samples were collected at each location for laboratory analysis. The first sample was utilized to establish the horizontal extent of constituents detected at concentrations exceeding the applicable soil cleanup criteria. The remaining samples were utilized to establish the vertical extent of constituents detected at concentrations exceeding the applicable soil cleanup criteria. At each location, the first two samples were analyzed for the analytical groups identified during the Soils-SI with applicable soil cleanup exceedances (Table B1-2). In the event that a constituent exceeded the applicable soil residential cleanup criteria in the vertical delineation sample, the sample

location was re-visited and a third sample was collected at a greater depth, typically 4-ft below the previous sample, and analyzed for the exceeding analytical group.

It was only possible to collect horizontal delineation samples at sample locations within the Miscellaneous/Offsite Area,. The steep terrain of the prominent ridges in this area made access with large powered sample equipment infeasible. Therefore, the use of manual soil sampling equipment was necessary. Hand operated equipment could not be advanced to the depths attainable by powered equipment due to lithology (glacial till) therefore vertical delineation samples could not be collected. However, no known Facility operations were performed in this undeveloped area. As presented in Section 5.0, a very small percentage of samples collected exceeded the applicable soil cleanup criteria.

Soil boring logs are presented in Appendix B. Soil boring photographic logs are presented in Appendix C (if sample was collected via the test pit sampling method).

2.4.3 Hydraulic Oil Trench Investigation

The Facility operated hydraulically controlled presses as part of the smokeless gunpowder manufacturing process. Historically, the presses were operated with standard hydraulic oil conveyed through piping from centralized pump houses. The hydraulic oil was later replaced with a vegetable oil that was more cost effective and easier to manage. There are no records available for review concerning the operation or maintenance of the former hydraulic oil conveyance system and it is not known if historical releases occurred.

To evaluate the potential of historical releases from the former hydraulic oil conveyance system (i.e., piping) a series of seven trenches were excavated to intersect the water table in the areas the hydraulic oil piping was formerly present (Figure B-1). The trenches ranged in length from approximately 30 to 100-ft.

One soil sample was collected from each of the seven trenches, biased to the location of greatest potential environmental concern with the exception of one trench where two samples were collected due to field observations, which indicated two hydraulic lines

formerly existed. A total of eight trench samples were collected from eight locations from seven trenches with an average depth of 7.1-ft bgs and a maximum depth interval of 10.0 to 10.5-ft. bgs (Table B5-3) (Figure B-1). The sample selection process included visual observation, VOC screening with a PID, and professional judgment. These samples were analyzed for site-specific petroleum related VOCs such as Benzene, Toluene, Ethylbenzene, Xylenes (collectively referred as BTEX), Tert-Butyl Methyl Ether (MTBE), Polynuclear Aromatic Hydrocarbons (SVOC-PAHs), and petroleum hydrocarbons (PHCs) per the TRSR because hydraulic oil was the only potential source of environmental concern (Table B1-4). These samples were also submitted for fingerprinting analyses in an attempt to identify the specific type of petroleum product present, if any (Table B1-4).

Trench logs for three of the trench sample locations are presented in Appendix B. The trench logs for the remaining five trench sample locations were inadvertently misplaced after the RI field event and are not included in this report. Photographic logs for all eight trench sample locations are presented in Appendix C.

2.4.4 Recently Identified AOCs Not Previously Investigated

Eight additional AOCs (debris areas) were identified during implementation of RI field activities (Figure B-47). These areas appear to have been historically low-lying isolated portions of the Facility that were filled with debris (historic fill, scrap steel/iron, and general refuse).

Exploratory visual observation test pits were excavated in the center of each AOC. A total of nine test pits were excavated to a maximum depth of 9-ft. bgs. No analytical samples were collected, but these soil borings were visually inspected and classified. The intention of the test pits was to provide a preliminary assessment of the nature of the debris present within each area. Soil boring logs are provided in Appendix B and photos are presented in Appendix C. The recently identified debris areas will be addressed in the future actions work plan included in Volume A.

2.4.5 Sample Locations Proposed But Not Sampled

Due to the limited accessibility and difficulty of soil boring advancement caused by subsurface gravels, boulders, and limited soils, the sample locations listed in the following table were proposed in the Revised Site-Wide RIWP but samples were not able to be collected during the RI. However, due to the large number of samples collected (and the results of those samples discussed in Section 5.0), the intent of the RI was met and these samples were not necessary.

Remedial Area	Former Operational Area	Preliminary Location ID
Area I	B-Line	R-319
Area I	B-Line	R-330
Area I	B-Line	R-333
Area I	B-Line	R-344

Area I	Storage	R-350
Area I	Storage	R-357
Area I	Storage	R-359
Area I	Storage	R-392
Area II	Dynamite	R-144

* = The preliminary location ID was established in the Revised Site-Wide RIWP.

2.5. SAMPLE IDENTIFICATION

All soil field analytical samples collected during the RI were designated with one of four alpha-numeric code types that uniquely identify each sample as being collected from a soil boring, test pit, hydraulic oil pipeline trench sample location, or non-sample-specific location for field or laboratory QA/QC. Formulation for each of the four codes is presented in the following sections.

2.5.1 Soil Boring Sample Identification

Soil sample locations were designated with an alpha-numeric code that identified each sample by the matrix sampled, primary field event, grid number, sequential sample number, depth interval, and field QA/QC type (if applicable). Sampled matrices were identified by a two-letter code (i.e., SB for soil boring samples). The primary field event was identified by a one letter code (i.e., R for RI) with the exception of Area I AOC-based samples. Area I AOC-based soil samples were identified by a letter and number code (i.e., R0 for remedial investigation AOC-based soil samples). The grid number corresponded to the facility grid location (i.e., A11). Sequential sample numbers at each new sampling location for each sample type began with 01 and increased accordingly. Depth intervals for soil samples included the depths to the top and bottom of the sample interval. Field QA/QC types were utilized if the sample was submitted as a sample-specific QA/QC sample (i.e., field duplicate (DUP), matrix spike (MS), matrix spike duplicate (MSD)).

The following is a guide for soil sample identification:

Matrix	Primary Field Event	Grid Number	Sequential Sample	Top and bottom of Sample Interval (ft. bgs)	Field QA/QC Type (if applicable)
AA	AN*	ANN	NN	(N-N)	(AA)

bgs = below ground surface

*Only soil samples collected from Area I AOC-based locations include a numeric character in the primary field event. All other samples only include an alphabetic character in the primary field event.

Where:

A = Alphabetic
N = Numeric

Examples of typical sample identifications for samples collected from soil locations are shown below:

- The first soil sample collected from Grid A11 from a depth interval of 1.0 to 1.5-ft. bgs (horizontal delineation sample) was labeled as SB-R-A11-01(1.0-1.5);
- The eighth soil sample collected from Grid A11 from a depth interval of 5.0 to 5.5-ft. bgs (vertical delineation sample) was labeled as SB-R-A11-08(5.0-5.5);
- The first Area I AOC-based soil sample collected from Grid M8 from a depth interval of 4.5 to 5.0-ft. bgs (vertical delineation sample) was labeled as SB-R0-M8-01(4.5-5.0);
- The fifth Area I AOC-based soil sample collected from Grid M8 from a depth interval of 0.5 to 1.0-ft. bgs (horizontal delineation sample) was labeled as SB-R0-M8-05(0.5-1.0),
- An MS soil sample collected from Grid A11 from a depth interval of 1.0 to 1.5-ft. bgs was labeled as SB-R-A11-01(1.0-1.5)_MS.

2.5.2 Test Pit Sample Identification

Test pit sample locations were designated with an alpha-numeric code that identified each sample by the matrix sampled, primary field event, grid number or AOC number, sequential sample number, depth interval, and field QA/QC type (if applicable). Sampled matrices were identified by a two-letter code (i.e., TP for test pit samples). The primary field event was identified by a one letter code (i.e., R for RI). The grid number corresponded to the facility grid location (i.e., A11). The AOC number corresponded to the SI AOC designation (i.e., C11-8572C). Sequential sample numbers at each new sampling location for each sample type began with 01 and increased accordingly. Depth intervals for soil samples included the depths to the top and bottom of the sample interval. Field QA/QC types were utilized if the sample was submitted as a sample-specific QA/QC sample (i.e., DUP, MS, MSD).

The following is a guide for soil sample identification:

Matrix	Primary Field Event	Grid Number	*AOC Designation	Sequential Sample	Top and bottom of Sample Interval (ft. bgs)	Field QA/QC Type (if applicable)
AA	A	ANN	AN	NN	(N-N)	(AA)

bgs = below ground surface

* = Only RI soil samples collected from AOCs identified in the SI include additional numeric and/or alphabetic characters after the grid number. All other test pit samples include only the grid number, followed by the sequential sample, depth interval, and applicable field QA/QC.

Where:

A = Alphabetic
N = Numeric

Examples of typical sample identifications for samples collected from test pit locations are shown below:

- The first test pit soil sample collected from Grid A11 from a depth interval of 8.0 to 8.5-ft. bgs (vertical delineation sample) was labeled as TP-R-A11-01(8.0-8.5);
- The fifth test pit soil sample collected from SI AOC C11-8572C from a depth interval of 9.0 to 9.5-ft. bgs (vertical delineation sample) was labeled as TP-R-C11-8572C-05(9.0-9.5); and,
- An MS test pit soil sample collected from Grid A11 from a depth interval of 8.0 to 8.5-ft. bgs was labeled as TP-R-A11-01(8.0-8.5)_MS.

2.5.3 Soil Hydraulic Oil Pipeline Trench Sample Identification

Hydraulic oil pipeline trench samples were designated with an alpha-numeric code that identified each sample with a matrix code, primary field event, sample type, sequential sample number, depth interval, and field QA/QC (if applicable). Sampled matrices were identified by a two-letter code (i.e., SB for soil). The primary field event was identified by a one-letter code (i.e., R for RI). Sample type was identified by a two-letter code (i.e., TR for trench sample). Sequential hydraulic oil pipeline sample location numbers began

with 01 and increased accordingly at each new sampling location. Depth interval designations for hydraulic oil pipeline trench samples included the top and bottom depths of the sample interval. Field QA/QC types were utilized if the sample was submitted as a sample-specific QA/QC sample (i.e., DUP, MS, MSD).

The following is a guide for soil hydraulic oil pipeline trench sample identification:

Matrix	Primary Field Event	Sample Type	Sequential Sample	Top and Bottom of Sample Interval (ft. bgs.)	Field QA/QC Type (if applicable)
AA	A	NN	NN	(N-N)	AA

Where:

A = Alphabetic

N = Numeric

Examples of typical sample identifications for samples collected from hydraulic oil pipeline trench sample locations are shown below:

- Hydraulic oil pipeline trench soil sample collected from location 02 from a depth interval of 5.0 to 5.5-ft. bgs was labeled as SB-R-TR-02(5.0-5.5); and,
- A field duplicate soil sample collected from location 02 from a depth interval of 5.0 to 5.5-ft. bgs was labeled as SB-R-TR-02(5.0-5.5)_DUP.

2.5.4 Non-Sample-Specific Locations for Field or Laboratory QA/QC Identification

Non-sample-specific locations for field or laboratory QA/QC were designated with an alpha-numeric code that identified each sample by the type of QA/QC, sample collection date, and matrix code (if applicable). The type of QA/QC sample was identified by a QA/QC code, (i.e., TB for trip blank). The sample collection date corresponded to the date the QA/QC sample was collected, using a mm/dd/yyyy format. Sampled matrices were identified by a two-letter code and indicate which matrix the QA/QC sample applies (i.e., SB).

The following is a guide for non-sample-specific field and laboratory QA/QC sample identification:

Type of QA/QC Sample	Sample Collection Date (mm/dd/yyyy)	Matrix Code (if applicable)
AA	NN/NN/NNNN	AA

Where:

A = Alphabetic
N = Numeric

Examples of typical sample identifications for non-sample-specific field and laboratory samples are shown below:

- An equipment blank (EQB) sample collected from decontaminated hand auger sampling equipment on June 21, 2006 was labeled as EQB-06212006-SO; and,
- A trip blank sample submitted on June 21, 2006 was labeled as TB-06212006.

- Note: Soil samples collected during the Soils-SI were designated in a similar format. Refer to Appendix A (Soils-SI) for a detailed description of soil site investigation sample identification.

2.6. LABORATORY ANALYSIS

During the RI, a total of 1,295 soil samples were collected from 611 sample locations for laboratory analyses, as identified below:

- 795 horizontal and vertical soil samples were collected from 395 AOC or grid based sample locations;
- Seven vertical delineation soil samples were collected from seven SI AOC-based locations;
- 485 horizontal and vertical delineation soil samples were collected from 208 locations from 44 AOCs reserved for the RI during the SI; and,
- Eight soil samples were collected from eight hydraulic oil pipeline trench sample locations from seven trenches.

Samples were submitted to Lancaster Laboratories, Inc. (LLI) of Lancaster, Pennsylvania, except for samples submitted for DDNP analysis (AOC H8-1). LLI is certified to provide laboratory services in the State of New Jersey (N.J. Certification No. 77011). DDNP analysis was performed by General Physics Laboratory (GPL) of Frederick, MD. GPL is certified to provide laboratory services in the State of New Jersey (N.J. Certification No. 60671).

With the exception of samples collected from the DDNP Ponds (H8-1) and hydraulic oil pipeline trench samples, the soil samples were analyzed for a site-specific suite of analytes based on the analytical results of the soil samples collected during the Soils-SI. Specifically, the RI analyte list is comprised of any constituent identified at concentrations exceeding the applicable soil cleanup criteria presented in the Soils-SI. Soil samples collected in the SI were submitted for laboratory analyses for portions of the PP+40 list. Table B1-1 presents the SI specific analytical requirements. Table B1-2 presents the RI specific analytical requirements (as identified by SI exceedances), including the soil specific constituent list and analytical method. Samples collected from the DDNP Ponds (H8-1) were analyzed for PP+40 list of SVOCs and E&E constituents, including DDNP (Table B1-3). The eight soil trench samples were analyzed for site-specific petroleum related VOCs (BTEX and MTBE), PAHs, and PHCs (Table B1-4). These samples were also submitted to LLI for fingerprinting analysis to identify the specific type of petroleum product present, if any.

Specific sample handling, QA/QC procedures, and analytical methodologies are provided in the AQAPP (MWH, 2005).

3.0 DATA QUALITY CONTROL

This section is a summary of the quality control review results for the soil samples collected as part of the RI. LLI performed the chemical analyses of all soil samples. All soil samples were validated by a third-party validator in accordance with the following Region II Standard Operating Procedures (SOPs) for data validation:

- Inorganics: Evaluation of Metals Data for the Contract Laboratory Program, United States Environmental Protection Agency (USEPA) Region II SOP HW-2, Revision 11, January 1992.
- Organics: Evaluation of Organic Data for the Contract Laboratory Program, USEPA Region II SOP HW-6, Revision 12, March 2001.
- Explosives: Explosives Residue SOP, USEPA Region II, Revision 1.3, September 1994.

Appendix D presents the data validation notes for each sample delivery group (SDG) pertaining to the RI. There were no sample results that were rejected for this project. The field samples and associated quality control samples were validated for the following parameters:

- VOCs using Method 8260B;
- SVOCs using Method 8270C;
- Total Polychlorinated biphenyls (PCBs) using Method 8082;
- Metals using Method 6010B/7471A;
- NC using Indiana Army Arsenal Procedure (IAAP);
- PHCs using Method 8015;
- NG using Method 8330;
- E&E using Method 8330; and,
- DDNP using Method 8330A modified.

The quality of the data was assessed according to the USEPA's PARCC (precision, accuracy, representativeness, comparability and completeness) parameters. These criteria were used to identify unacceptable or biased data that may require the laboratory to implement corrective actions, or otherwise require qualification of the data. The

following is a summary of the data quality evaluation and resulting qualification of the results, as applicable.

3.1. PRECISION AND ACCURACY

Precision and accuracy were evaluated based on the quality control results generated from laboratory MS and MSD samples, laboratory duplicates, laboratory control samples (LCS), internal compounds and surrogate spike compounds. In addition, initial and continuing calibration results were used to assess accuracy.

Analyses that failed to meet precision or accuracy limits established in the AQAPP, or defined by the laboratory if not specified in the AQAPP, were assigned a data qualifier in accordance with Region II SOPs as appropriate. There were no sample results that were rejected for this project. In the Region II SOPs for Explosives Residues (USEPA Region II 1994), the criteria required for rejection of E&E results for percent difference between the primary and secondary column exceeding 90% was not followed. If the percent difference was greater than 25%, the results were qualified as estimated, even if the percent difference was near or above 90%. The reported results with a high percent difference were considered usable since they were consistently reported by the laboratory from the primary column throughout the project, and the laboratory indicated the confirmatory column had five compounds that co-eluted.

3.1.1 Matrix Spikes/Matrix Spike Duplicate

MS and MSD samples were collected in the field and sent to the laboratory along with the field samples. If a field sample was not designated as an MS and MSD for a particular analysis, the laboratory provided MS results from the analytical batch, which were then used to assess accuracy. Data qualification was followed as specified in the Region II SOPs in cases where the accuracy limits were not met.

3.1.2 Laboratory Duplicates

Laboratory duplicates were analyzed as appropriate throughout the analytical program, with the exception of the E&E residues. Field duplicates were collected and utilized to

assess precision and accuracy for E&E analysis rather than laboratory duplicates. Field duplicates were collected for E&E analysis at the frequency specified in the AQAPP and were sent to the laboratory to be analyzed. In general, it is more difficult to collect a duplicate field sample and retrieve acceptable results than it is for the laboratory to analyze a sub-sample of a sample and retrieve acceptable results. Thus, the amalgamation of laboratory duplicates and field duplicates ensured that the quality of data was not affected by the lack of laboratory duplicates, and also enabled laboratory and field precision to be reviewed during data validation. Additionally, the laboratory analyzed MS, MSD, LCS, and laboratory control sample duplicates (LCSD). Those quality control samples were also evaluated for precision for this project. Data exceeding limits were qualified as specified in the Region II SOPs.

3.1.3 Laboratory Control Samples

LCS were analyzed by the laboratory at the appropriate frequency throughout the project. Low or unacceptable LCS results led to qualification of laboratory data as specified in the Region II SOPs.

3.1.4 Surrogate Recoveries

Surrogate spikes were introduced into samples as required in the analytical methods. Surrogate recoveries that were outside control limits were qualified as estimated in accordance with the Region II SOPs.

3.1.5 Calibration

Initial and continuing calibration results were reviewed against specific analytical method criteria. Calibration results that were outside acceptable limits were then qualified for the particular failing compounds, in accordance with the Region II SOPs.

The laboratory's SOP for E&E analysis, as specified in the AQAPP, differed slightly from the USEPA methodology to accommodate specific laboratory requirements. The initial calibration for E&E residues required in the Region II criteria specifies triplicate injection of each of the five calibration levels. The initial calibration provided in the data

packages consisted of a single, six-point calibration with calculated relative percent differences reported for review of linearity. Data were not qualified due to the laboratory employing different calibration criteria than that specified in the Region II SOPs. However, analytical instrumentation was calibrated and met method criteria, and the laboratory performed routine quality control checks during analysis of the samples; thus no impact of the data was identified.

3.2. REPRESENTATIVENESS

Representativeness was evaluated through the analysis of laboratory method blank samples, field blank samples, and trip blank samples. Analysis of these types of samples was important to distinguish between ambient sampling and analytical levels, and actual site contamination. The blanks were analyzed per the method requirements. There were no data rejected due to anomalies identified in any of the blanks. Blank data were used to further qualify associated field data if applicable.

3.3. COMPLETENESS

Data completeness was evaluated based on the samples requested on the chain-of-custody (COC) documentation and the samples reported by the laboratory.

The following anomalies were noted during the completeness review:

- SDG KVL70 - The laboratory noted that a trip blank was not received with the 4/12/06 sample shipment, however, a trip blank was included with the 4/4/06 sample shipment which was not originally listed on the COC. For the VOC analyses, the laboratory noted that the weight for several samples was outside the 8 to 12g requirement. The samples were analyzed for VOCs. The laboratory noted the nitrocellulose was not documented on the COC for several samples. The laboratory was contacted and the samples were analyzed for nitrocellulose. No validation was required because this anomaly was solely a documentation issue that was resolved prior to analysis.
- SDG KVL 72 - The laboratory noted that two extra samples were received in the shipment but were not on the COC: SB-R-I8-03(4.5-5.0) and SB-R-K8-02(0.5-1.0). The laboratory was contacted and the samples were analyzed. The laboratory noted that COC had extra "O's" in the sample IDs. No validation was required because this anomaly was solely a documentation issue that was resolved prior to analysis.

- SDG KVL85 - The laboratory noted that sample SB-R-N5-02(0.5-1.0) was received outside the weight of 8-12g for VOCs. The sample was analyzed for VOCs. No validation was required because this anomaly was compensated for by the laboratory and the results were based on the actual sample weight.
- SDG KVL86 - The laboratory noted that sample SB-R-O8-01(0.5-1.0) and SB-R-O8-01(5.5-6.0) should have been labeled SB-R-O8-O3. The laboratory was contacted and the samples were identified and analyzed. No validation was required because this anomaly was solely a documentation issue that was resolved prior to analysis.
- SDG KVM15 - The laboratory noted that one jar was received with no label and it was for SB-R-B13-04 at 9:45. The laboratory was contacted and the sample was identified and analyzed. No validation was required because this anomaly was solely a documentation issue that was resolved prior to analysis.
- SDG KVM60 - The laboratory noted the weight for sample 4818667 was outside the 8-12g criteria. The sample was analyzed for VOCs. No validation was required because this anomaly was compensated for by the laboratory and the results were based on the actual sample weight.
- SDG KVM 67 - Sample 4823181 was outside of the 8-12 g weight for the VOC analysis. The sample was analyzed for VOCs. No validation was required because this anomaly was compensated for by the laboratory and the results were based on the actual sample weight.
- SDG KVM71 - The sample weight for TP-R-K5-2-3(9.0-9.5) was outside 8-12g requirement. The sample was analyzed for VOCs. No validation was required because this anomaly was compensated for by the laboratory and the results were based on the actual sample weight.
- SDG KVM75 - The laboratory noted that the weight for sample 4829975 was outside the 8-12g requirement. The sample was analyzed for VOCs. No validation was required because this anomaly was compensated for by the laboratory and the results were based on the actual sample weight.
- SDG KVM78 - The laboratory notes that the weight for sample 4830920 was outside the 8-12g requirement. The sample was analyzed for VOCs. No validation was required because this anomaly was compensated for by the laboratory and the results were based on the actual sample weight.

There were SDGs in which the cooler temperature exceeded 4 degrees Celsius (C). Per Region II SOPs, samples were to be qualified if received at a temperature above 4 degrees C. For validation purposes, it was assumed that results were considered acceptable (no qualification) if the cooler temperature was below 5 degrees C.

3.4. COMPARABILITY

Comparability was achieved by analyzing the samples according to the specified standard methods, reporting limits and holding times for both extraction and analysis. The laboratory analyzed the field samples in accordance with the methods specified in the AQAPP. The laboratory method detection limits (MDLs) are compared to applicable soil cleanup criteria and summarized in Tables B1-9 and B1-10. SI sediment-soil samples do not have accurate MDL values due to erroneous electronic data deliverables (EDDs) received from the laboratory. Thus, MDLs for SI sediment-soil samples were not compared to applicable soil cleanup criteria. The actual practical quantitation limits (PQLs) of non-detected concentrations are compared to applicable soil cleanup criteria, and the comparison results are summarized in Tables B1-6 through B1-8. The reporting limits provided by the laboratory were elevated if the sample was analyzed at a dilution. Data were not qualified based on elevated reporting limits. Samples that were analyzed outside holding times were qualified as estimated if the sample was extracted or analyzed within two times the required holding time, per Region II SOPs.

3.5. SUMMARY OF DATA QUALITY AND RELIABILITY

The evaluation of the data against PARCC criteria provided information on the data quality and reliability. As a result of this evaluation, all data are of known and acceptable quality, as qualified based on the laboratory-established acceptance control limits or Region II guidance. These data are considered valid and useable for decision-making purposes.

3.6. DATA QUALITY OBJECTIVES

The data quality objectives (DQOs) set forth in the AQAPP and the comparison of these DQOs with actual laboratory data results are summarized in the following table. Only DQOs specific to definitive data and resulting data validation are summarized.

DQO Summary For Data Validation Parameters:

Parameter	Sample Media	DQO goal	DQO Met?	Comments
Sample documentation	Soil	100%	Yes	Discrepancies were noted by laboratory and resolved.
COC documentation	Soil	100%	Yes	Discrepancies were noted by laboratory and resolved.
Instrument calibration meets laboratory's specification	Soil	100%	Yes	Data exceeding criteria were qualified.
Analyte identification and quantification	Soil	100%	Yes	
Trip blanks for VOCs	Soil	1 per cooler	Yes	
Instrument blanks	Soil	GC -every 10 samples GC/MS – every 12 hours Metals – every 10 samples	Yes Yes Yes	
Laboratory method blank	Soil	1 per SDG	Yes	
Equipment blank	Soil	1 per day	Yes	Sampled as appropriate.
Laboratory precision and accuracy	Soil	100% within established limits for MS, LCS, duplicates, surrogates	Yes	Data exceeding precision and accuracy limits were qualified.
Laboratory MDLs<PQLs	Soil	100%	Yes	
LCS samples	Soil	100% within established limits per SDG	Yes	Data exceeding limits were qualified.
MS/MSD samples	Soil	5%	Yes	
Field duplicates	Soil	5%	Yes	

GC/MS = Gas Chromatograph/Mass Spectrometer

All analytical DQOs as set forth in the AQAPP were met. Data that exceeded limits for LCS and MS/MSD samples were qualified in accordance with the Region II SOPs as applicable.

4.0 REGIONAL AND SITE SPECIFIC GEOLOGY AND HYDROGEOLOGY

The regional and site specific geology is discussed in detail in Section 4.0 of Volume C – Groundwater RIR, and illustrated on the following figures in Volume C:

- C-4-1 Bedrock geologic map;
- C-4-2 Bedrock surficial geologic map;
- C-4-3 Regional geologic cross section;
- C-2 Cross Section Location Map;
- C-3 Geologic Cross Section A-A';
- C-4 Geologic Cross Section B-B';
- C-5 Geologic Cross Section C-C'; and
- C-6 Geologic Cross Section D-D'.

5.0 RESULTS

The following sections present the results of the analytical soil samples collected during the Soils-SI and RI to determine the nature and extent of constituents present at concentrations exceeding the applicable soil cleanup criteria. The analytical results from both the SI and RI are presented in this section. Appendix A presents the Soils – SI Report. The Soil – SI analytical data was utilized to develop the RI-specific analyte list based on SI analytical results indicating constituents at concentrations exceeding the applicable soil cleanup criteria.

This section is designed to comply with the intent of the TRSR for reporting remedial investigations (N.J.A.C. 7:26E-4.8(b)). The results narrative is supported by data tables and figures that aid in data evaluation and presentation, per N.J.A.C. 7:26E-4.8(c).

The following tables present the number of soil sample locations and analytical samples collected during the Soils-SI and RI (Figure B-1):

Discrete SI/RI Sample Locations			
	Area I	Area II	Area III
Number of SI Sample Locations	878	477	627
Number of SI Sediment Sample Locations - SI Sediment Samples Considered as Soils	9	13	7
Number of RI Sample Locations – AOC and Grid-Based	202	116	77
Number of RI Sample Locations – AOCs Reserved for the RI during the SI*	101	74	23
Number of RI Sample Locations – DDNP Ponds	0	0	10
Number of RI Sample Locations - Trench Sample Locations	3	0	5
Total	1193	680	749
Site-Wide Total Number of Sample Locations = 2622			

* = Excludes AOC H8-1, DDNP Ponds

Note: Refer to Section 2.0 for sample category descriptions.

Total Number of SI/RI Samples			
	Area I	Area II	Area III
Number of SI Samples	878	480	627
Number of SI Sediment Samples Considered as Soils	9	13	7

Total Number of SI/RI Samples			
	Area I	Area II	Area III
Number of RI Samples – AOC and Grid-Based	409	234	159
Number of RI Samples – AOCs Reserved for the RI during the SI*	234	177	51
Number of RI Samples – DDNP Ponds	0	0	23
Number of RI Samples - Trench	3	0	5
Total	1533	904	872
Site-Wide Total Number of Samples = 3309			

* = Excludes AOC H8-1, DDNP Ponds

Note: Refer to Section 2.0 for sample category descriptions.

Breakdown of Horizontal/Vertical Delineation Samples			
	Area I	Area II	Area III
Number of Horizontal SI Samples	878	477	627
Number of Vertical SI Samples Collected	0	3	0
Number of Horizontal SI Sediment Samples	9	13	7
Number of Vertical SI Sediment Samples	0	0	0
Number of Horizontal RI AOC or Grid-based Samples	202	116	77
Number of Vertical RI AOC or Grid-based Samples	207	118	82
Number of Horizontal RI Samples Collected from AOCs Reserved for the RI*	101	74	23
Number of Vertical RI Samples Collected from AOCs Reserved for the RI *	133	103	28
Number of Horizontal RI Samples Collected from DDNP Ponds	0	0	10
Number of Vertical RI Samples Collected from DDNP Ponds	0	0	13
Number of Horizontal RI Trench Samples	3	0	5
Number of Vertical RI Trench Samples	0	0	0
Total Number of Horizontal Delineation Samples	1193	680	749
Total Number of Vertical Delineation Samples	340	224	123
Total Number of Horizontal and Vertical Delineation Samples	1533	904	872
Site-Wide Total Number of Horizontal Delineation Samples = 2622			
Site-Wide Total Number of Vertical Delineation Samples = 687			
Site-Wide Total Number of Horizontal and Vertical Delineation Samples = 3,309			

* = Excludes AOC H8-1, DDNP Ponds

Note: Refer to Section 2.0 for sample category descriptions.

5.1. SELECTION OF COMPARISON CRITERIA

The following sections present the regulatory criteria selected for comparison to the laboratory analytical results. During the initial comparison of NJDEP criteria to laboratory analyzed sample results, it was noted that some detected constituents did not have corresponding NJDEP criteria. Hercules selected alternate criteria for comparison to the detected constituents without established NJDEP criteria from other NJDEP recognized sources. In all cases, an established NJDEP criteria was first sought using NJDEP guidance.

The intent of using the alternate criteria is to provide a screening level indication for the evaluation of potential environment influence of detected constituents that are without established NJDEP criteria. Tables B1-2, B1-3, B1-4, and B1-5 present a complete list of the applicable soil criteria and sources applied in the RIR.

5.1.1 Soil Quality Standards

The analytical results of the soil samples were compared to the following regulatory criteria:

- NJDEP Soil Cleanup Criteria revised on May 12, 1999 (NJSCC 1999), including Impact to Groundwater Soil Cleanup Criteria (IGWSCC), Residential Direct Contact Soil Cleanup Criteria (RDCSCC), and Non-Residential Direct Contact Soil Cleanup Criteria (NRDCSCC).
- Criteria for several E&E constituents, 2,4-Dinitrotoluene (2,4-DNT) and 2,6-Dinitrotoluene (2,6-DNT) (SVOCs) were provided to Hercules by NJDEP in a letter on June 19, 2003, including IGWSCC, RDCSCC, and NRDCSCC.
- Criteria for three SVOCs (1,2-Diphenylhydrazine (DPHY12), Benzidine (BZD), and N-nitrosodimethylamine (NNSM)) were obtained from the proposed New Jersey Draft Soil Remediation Standards published in the New Jersey Register on July 19, 2004, including IGWSCC, RDCSCC, and NRDCSCC.

For the purpose of this report, the term SCC (soil cleanup criteria) is used as a collective term and encompasses the aforementioned criteria sources as a whole. Table B1-1 presents the SI-specific analytical methods and the SCC available at the time of the SI. Tables B1-2, B1-3, and B1-4 present the RI-specific analytical compounds and the SCC

applied in the RI report. Several criteria have changed during the development of the RI report due to incorporation of the additional sources cited above. The updated criteria are summarized in Table B1-5. For the RI report, both SI and RI analytical results are compared to the updated criteria in Tables B1-2, B1-3, and B1-4. Due to the large volume of the SI data, the SI results have not been completely reproduced and included in the RI report. Instead, the SI exceedances are summarized only for the constituents with criteria updated since the SI (Table B5-9). In addition, SI Sediment analytical results compared to the SCC are presented in Table B5-10. The complete SI results and exceedances are provided in Appendix A of this report (Soils-SI report).

The NJDEP does not currently publish SCC for three SVOCs (DPHY12, BZD, and NNSM) and an alternate screening value was selected from the proposed New Jersey Draft Soil Remediation Standards published in the New Jersey Register on July 19, 2004 as part of the RIR development process. The analytes selected for laboratory analysis of soil samples during the RI were selected prior to locating the alternate soil screening values. Therefore DPHY12, BZD, and NNSM were not selected for analysis during the RI.

5.2. FREQUENT EXCEEDANCE CONSTITUENTS

Frequent exceedance constituents (FECs) are identified for each media to facilitate and focus the site-wide understanding of key media-specific constituent exceedances. FECs are generally defined as those constituents with significant percentages of detected concentrations above the corresponding media-specific criteria (determined by the number of exceedances divided by the total number of analyses for a specific constituent). The FEC concept was developed to provide a tool to assist RIR reviewers with assimilating an enormous amount of data in a timely and efficient manner. The concept will also be useful in a similar manner during development of the Remedial Action Selection Report (RASR) to identify constituents that will drive remedy selection. The FEC concept was not developed to provide a mechanism to eliminate any constituents of exceedance from future remedial action selection or compliance attainment.

The basis for establishing the specific percentage of exceedances beyond which a constituent is considered as a FEC varies from media to media, but it generally follows the rationale that by setting the percentage at an appropriate level, the nature and extent of the FECs thereby defined will reasonably represent the overall site-wide nature and extent of exceedances in that media.

Soil FECs are defined for the purpose of this report as constituents with detected concentrations exceeding the RDCSCC at relatively higher frequencies in each analytical group on a site-wide basis. The thresholds for each analytical group vary slightly, and are 5.5% (SVOCs), 5% (Metals), 2.5% (E&E) and 4% (Total PCBs). No VOCs were selected as FECs due the overall low frequency of RDCSCC exceedances of VOCs (less than 0.6%) (Figures B-3 through B-5, Tables B2-4, B3-4, B4-4, B5-6, and B5-7). The following nine FECs were identified for soil:

- SVOCs: Benzo(b)fluoranthene (BZBF), Benzo(a)pyrene (BZAP), and 2,4/2,6-Dinitrotoluene (2,4/2,6-DNT);
- Metals: Lead, Arsenic, and Thallium;
- E&E: NG and TNT; and,
- Total PCBs.

The following tables present each constituent detected through laboratory analysis in SI and RI soil samples and the relative frequency the constituent was detected at a concentration exceeding the IGWSCC, RDCSCC, and NRDCSCC. The relative frequency of IGWSCC, RDCSCC, and NRDCSCC exceedances is included in the table below to provide the reader with a comparison of detected constituents to all applicable criteria. However, only constituents with detected concentrations exceeding the RDCSCC at relatively higher frequencies in each analytical group were selected as FECs. The soil FECs are bolded in the tables.

VOCs – IGWSCC Exceedances:

Constituent	IGWSCC (µg/kg)	Total Number of Locations	Total Number of Samples Analyzed	Total Number of Analyses	Total Number of IGWSCC Exceedances	Relative Frequency of IGWSCC Exceedances
Acrylonitrile	1000	206	296	296	1	0.34%
Benzene	1000	588	972	973	8	0.82%
Chlorobenzene	1000	421	648	648	1	0.15%
Methylene Chloride (MTLNCL)	1000	815	1336	1337	6	0.45%
Trichloroethylene (TCE)	1000	208	208	209	1	0.48%

VOCs – RDCSCC/NRDCSCC Exceedances:

Constituent	RDCSCC (µg/kg)	NRDCSCC (µg/kg)	Total Number of Locations	Total Number of Samples Analyzed	Total Number of Analyses	Total Number of RDCSCC Exceedances	Relative Frequency of RDCSCC Exceedances	Total Number of NRDCSCC Exceedances	Relative Frequency of NRDCSCC Exceedances

HMX	3900000	10000000	1609	2231	2235	1	0.04%	0	0.00%

PCBs – IGWSCC Exceedances:

Constituent	IGWSCC (µg/kg)	Total Number of Locations	Total Number of Samples Analyzed	Total Number of Analyses	Total Number of IGWSCC Exceedances	Relative Frequency of IGWSCC Exceedances
Total PCBs	50000	626	1146	1146	2	0.17%

PCBs – RDCSCC/NRDCSCC Exceedances:

Constituent	RDCSCC (µg/kg)	NRDCSCC (µg/kg)	Total Number of Locations	Total Number of Samples Analyzed	Total Number of Analyses	Total Number of RDCSCC Exceedances	Relative Frequency of RDCSCC Exceedances	Total Number of NRDCSCC Exceedances	Relative Frequency of NRDCSCC Exceedances
Total PCBs	490	2000	626	1146	1146	51	4.45%	19	1.66%

2,4-DNT and 2,6-DNT were analyzed as both SVOCs by USEPA SW846 Method 8270 (8270) and E&E by USEPA SW846 Method 8330 (8330) during the SI. These constituents were analyzed as SVOCs only during the RI because of better performance of the 8270 method in analyzing them. For the purpose of the RIR, 2,4-DNT and 2,6-DNT analyzed by 8270 was first sought. If the sample was only analyzed by 8330 for 2,4-DNT and 2,6-DNT, this result was used. Nitrobenzene was also analyzed as both SVOCs (8270) and E&E (8330) during the SI. For the purpose of the RIR, Nitrobenzene analyzed by 8330 was first sought due to the superior performance of this method for this compound. If the sample was only analyzed by 8270 for Nitrobenzene, this result was used.

Figures B-19 through B-45 present site-wide constituent contours for each FEC (BZAP, BZBF, 2,4/2,6-DNT, Arsenic, Lead, Thallium, TNT, NG, and Total PCBs respectively).

5.3. ORGANIZATION OF RESULTS

The analytical result narrative discussion is presented by remedial area (Areas I, II and III) and by analytical group. For ease of presentation, the results of the soil samples collected in the Miscellaneous/Off-Site Area are incorporated into the adjacent remedial areas in results discussions and associated tables and figures. The soil analytical results discussed in detail in the following sections are presented utilizing the Facility-wide grid system as necessary, (discussed in Appendix A Soils – SI), to aid the reviewer in locating the samples and affected areas on each figure. The analytical results narrative discussion is supported by the following tables and figures to facilitate data presentation and interpretation:

Note - Tables presenting analytical results for samples collected from AOCs Reserved for the RI exclude samples collected from AOC H8-1 (DDNP Ponds). Analytical results for samples collected from H8-1 are presented on separate tables due to extended analytical list of constituents analyzed (Refer to Section 2.4.1.3).

Tables

- SI-specific analytes, analytical methods, selected criteria, and sources for soil samples collected in the SI are presented in Table B1-1.
- RI-specific analytes, analytical methods, selected criteria, and sources for soil samples collected in the RI are presented in Table B1-2 (AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B1-3 (DDNP Ponds), and Table B1-4 (Trench).
- Updated SCC values for SI-specific analytes with criteria changes since completion of the Soils-SI are presented in Table B1-5.
- RI and SI Sediment-Soil analytical samples with PQLs exceeding the SCC are presented in Table B1-6 (AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B1-7 (DDNP Ponds), and Table B1-8 (Sediment-Soil).
- RI analytical samples with MDLs exceeding the SCC are presented in Table B1-9 (AOC-Based, Grid-Based, AOCs Reserved for the RI) and Table B1-10 (DDNP Ponds).
- AOCs Reserved for the RI and justification for reserving the AOCs for the RI are presented in Table B2-1 (Area I), Table B3-1 (Area II), Table B4-1 (Area III), and Table B5-1 (DDNP Ponds).
- RI sampling and analysis plans including SCC exceedances by analytical group (VOCs, SVOCs, Metals, E&E and PCBs) are included in Table B2-2 (Area I - AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B3-2 (Area II - AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B4-2 (Area III - AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B5-2 (DDNP Ponds), and Table B5-3 (Trench).
- A comparison of the RI analytical results to the SCC by operational area (i.e., B-Line, Development, Finishing and Storage for Area I), and then by location ID and sample ID is presented in Table B2-3 (Area I - AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B3-3 (Area II - AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B4-3 (Area III - AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B5-4 (DDNP Ponds), and Table B5-5 (Trench).
- A summary of the RI analytical results identifying SCC exceedances by operational area (i.e., B-Line, Development, Finishing and Storage for Area I), and then by location ID and sample ID is presented in Table B2-4 (Area I - AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B3-4 (Area II - AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B4-4 (Area III - AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B5-6 (DDNP Ponds), and Table B5-7 (Trench).

- Sample locations with currently incomplete horizontal delineation are presented in Table B2-5 (Area I - AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B3-5 (Area II - AOC-Based, Grid-Based, AOCs Reserved for the RI), and Table B4-5 (Area III - AOC-Based, Grid-Based, AOCs Reserved for the RI).
- Sample locations with currently incomplete vertical delineation are presented in Table B2-6 (Area I - AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B3-6 (Area II - AOC-Based, Grid-Based, AOCs Reserved for the RI), Table B4-6 (Area III - AOC-Based, Grid-Based, AOCs Reserved for the RI), and Table B5-8 (DDNP Ponds).
- A summary of SI analytical results identifying SCC exceedances based on updated SCC criteria since completion of the Soils-SI is presented in Table B5-9.
- A comparison of SI Sediment analytical results to the SCC by operational area (i.e., B-Line, Development, Finishing and Storage for Area I), and then by location ID and sample ID is presented in Table B5-10.

Figures

- Figure B-1 presents the site-wide soil sample location map. Both RI and SI sample locations are included on this figure.
- Figure B-2 presents the site-wide historic fill iso-pach contour map to illustrate the estimated thickness.
- Figures B-3 through B-17 present site-wide areal extent of analytical groups that exceed the IGWSCC/RDCSCC/NRDCSCC (VOCs, SVOCs, Metals, E&E and PCBs, respectively). Analytical samples are presented in the following formats:
 - Sample locations with analytical samples collected at multiple discrete depths are presented as a series of color coded boxes (relative to sample depth) placed adjacent to the corresponding sample location. The color-codes represent RDCSCC exceedances (orange), NRDCSCC exceedances (red), IGWSCC exceedances (dark blue), RDCSCC/NRDCSCC compliance (green), or IGWSCC compliance (light blue); and,
 - Sample locations with analytical samples collected at a single discrete depth are presented as a single point and box. The sample location and sample ID represent RDCSCC exceedances (orange), NRDCSCC exceedances (red), RDCSCC/NRDCSCC compliance (green). The box represents IGWSCC exceedances (dark blue) or IGWSCC compliance (light blue).
- Figure B-18 presents the composite areal extent of exceedances inclusive of all analytical groups.

- Figures B-19 through B-45 present isoconcentration contour maps for each FEC (BZAP, BZBF, 2,4/2,6 DNT, Arsenic, Lead, Thallium, TNT, NG, and Total PCBs, respectively). Analytical samples are presented in the following formats:
 - Sample locations with constituents that were not detected at concentrations exceeding the IGWSCC/RDCSCC/NRDCSCC but where the PQL exceeded the IGWSCC/RDCSCC/NRDCSCC are color-coded blue;
 - Sample locations are further color-coded to indicate RDCSCC exceedance (orange), NRDCSCC exceedance (red), IGWSCC exceedance (dark blue), or compliance (green) per the analytical concentration of the presented FEC; and,
 - The highest analytical concentration is presented if samples were collected at multiple depths (horizontal or vertical delineation samples) from a specific sample location.
- Figure B-46 presents SI AOCs Reserved for the RI.
- Figure B-47 presents recently identified AOCs not previously investigated.

Twenty-three samples collected from the active firing range during the SI are not presented on the figures in this report. As discussed in Section 2.0, this firing range was not included in the scope of the RI.

5.4. GEOSTATISTICAL MODELING AND CRITERIA CONTOURING METHODOLOGY FOR FEC AND AREAL EXTENT FIGURES

Geostatistical modeling using Surfer (8.04)[®] was utilized to aid in generating the aforementioned figures and provide isoconcentration contouring based upon the SI and RI data sets. The following subsections present the methods utilized to contour the resulting predictions for the areal extent and FEC figures.

5.4.1 Geostatistical Modeling for FEC Figures

A geostatistical analysis of the analytical results for each FEC, which included variogram analysis and modeling was performed using Surfer (8.04)[®]. A variogram is a measure of the average dissimilarity between pairs of points (analytical results for each sample

location by FEC) separated by a given vector distance, as a function of that distance (Geostatistical Software Library and Users Guide, 2nd Edition (GSLIB), 1998).

The variogram for each FEC was generated utilizing a combination of the SI and RI data sets. The combined data set treated all non-detect or “U” qualified concentrations as half of the PQL. In addition, a small portion of FEC concentrations from the SI data set were qualified as either “R” (rejected), or as “E” (exceeded the instrument’s calibration range). These were excluded from the analysis of each individual FEC.

Variogram model selection followed two chief principles: the model should show consistency with the observations, and the model should show consistency with site knowledge. Models were then selected to best fit the variogram produced for each individual FEC. The following table is a summary of the results of the variogram analysis:

Individual FEC	Best Fit Model
Arsenic	Exponential (IGWSCC), Linear (RDCSCC and NRDCSCC)
Lead	Linear
Thallium	Linear
BZAP	Linear
BZBF	None*
NG	Logarithmic
TNT	Linear
2,4/2,6-DNT	Linear (IGWSCC only) None* (RDCSCC and NRDCSCC)
Total PCBs	Linear

* Triangulation with linear interpolation was utilized.

For each FEC simple Kriging was utilized in the prediction of intermediate soil concentrations with the exception of the FECs listed above with “None*” as the best fit model. Simple Kriging is an unbiased linear regression technique used in geostatistics that is an industry standard interpolation method for soils. Simple Kriging is a geostatistical technique that interpolates the value of a random location (i.e., the

analytical result of a FEC as a function of the neighboring analytical result) at an unobserved location from observations of its value at nearby locations (GSLIB, 1998). Simple Kriging is largely based upon the assumption that the covariance between sample results is only dependant upon the distance between two points. Surfer (8.04)[®] was utilized to grid the data set, with the selected model listed above, in grids varying between 25 and 85-sq. ft. When the variogram analysis determined that there were no specific models that best fit the variogram (indicated in the table above by “None*”), triangulation with linear interpolation was utilized. The triangulation with linear interpolation method utilized by Surfer (8.04)[®] uses the optimal Delaunay triangulation method. The algorithm creates triangles by drawing lines between data points. The original points are connected in such a way that no triangle edges are intersected by other triangles. The result is a patchwork of triangular faces over the extent of the grid. This method is an exact interpolator. Each triangle defines a plane over the grid nodes lying within the triangle, with the tilt and elevation of the triangle determined by the three original data points defining the triangle. All grid nodes within a given triangle are defined by the triangular surface (Surfer (8.04)[®] Users Guide, 2003).

5.4.2 Criteria Contouring for FEC Figures

Surfer (8.04)[®] was also utilized to produce the final FEC-specific criteria contours (RDCSCC, NRDCSCC, and IGWSCC (as applicable)) depicted in Figures B-19 through B-45. The resulting contours were then interpreted by an MWH geologist and adjusted based upon site knowledge and known physical boundaries (discussion of physical boundaries is presented below in Section 5.4.4). On each figure, the estimated area exceeding the three criteria are enclosed by a color coded line as follows.

- The blue line represents the estimated area exceeding the IGWSCC.
- The orange line represents the estimated area exceeding the RDCSCC.
- The red line represents the area exceeding the NRDCSCC.

The following table presents a summary of the contoured concentrations for each FEC and analytical group:

Individual FEC	IGWSCC (Blue Line)	RDCSCC (Orange Line)	NRDCSCC (Red Line)
Arsenic (mg/kg)	NS	20	20
Lead (mg/kg)	NS	400	600
Thallium (mg/kg)	NS	2	2
BZAP (µg/kg)	100000	660	660
BZBF (µg/kg)	50000	900	4000
NG (µg/kg)	NS	46000	200000
TNT (µg/kg)	40	21000	95000
2,4/2,6-DNT (µg/kg)	0.3	940	4200
Total PCBs (µg/kg)	50000	490	2000

NS - No standard, Metals do not have IGWSCC

5.4.3 Criteria Contouring For Areal Extent Figures

A data set that combined each depth interval for each sample location was created for each analytical group (i.e. VOCs, SVOCs, Metals, E&E, and Total PCBs) to generate contours representative of IGWSCC, RDCSCC, and NRDCSCC for each areal extent figure (Metals do not have an established IGWSCC). This data set was converted such that if any analyte was detected at any depth interval and exceeded the criteria per sample location it was assigned a value of one (1). All other values were assigned a value of zero (0). Because of the binary nature of this data set, a variogram analysis could not be performed, instead a linear variogram model was utilized. As with the previous contouring, Surfer (8.04)[®] was used to perform the simple Kriging and a grid was generated and contoured. Instead of representing an actual analytical result as was accomplished in the FEC figures, a half way point or 0.5 contour was generated and these resulting contours were then interpreted by an MWH geologist and adjusted based upon site knowledge and known physical boundaries. This method was performed for each of the criteria and overlayed on the areal extent figures. These contours were utilized to

produce the analytical group specific areas that exceed the criteria that have been depicted in Figures B-3 through B-18.

The following reference materials were utilized in development of FEC and areal extent contours:

- Geostatistical Software Library and User's Guide, 2nd Edition (GSLIB), 1998. Deutsch and Journel, Oxford University Press Inc.
- Surfer[®] Version 8.04, 2003. Surface Mapping System, Golden Software, Inc.

As discussed in the sections above, the horizontal limits of constituents present at concentrations exceeding the SCC on areal extent figures are inferred based on locations where constituents exceeded the SCC by analytical group. On FEC figures, the horizontal limits of constituents present at concentrations exceeding the SCC are based on locations where constituents exceeded the SCC and locations where half the PQL exceeded the SCC. Therefore, since the FEC figures take a more conservative approach (using half the PQL) than the areal extent figures in defining the horizontal limits, the anticipated areas where constituents may be present at concentrations exceeding the applicable criteria on the areal extent figures will be smaller than the combined areas from FEC figures for a given analytical group.

5.4.4 Horizontal Limit Determination

For the purpose of horizontal delineation contouring and discussion, several physical boundaries were utilized and include the following:

Horizontal Limits:

- Eastern and western ridges
- Ponds
- Wetland Areas

No physical boundaries were utilized to aid determination of vertical limits.

5.5. HISTORIC FILL DISCUSSION

Historic fill (fly ash, bottom ash, and slag) was encountered in the subsurface soils at the Facility during the SI and RI field activities, decontamination and demolition efforts, and routine maintenance activities. Historic fill was primarily emplaced at the Facility to support expansion activities. Volume A presents a detailed description of the Facility's history, including expansion activities. A brief discussion of the Facility's history is also included below as it relates to historic fill.

The Facility began as a small operation in 1871 and solely produced dynamite to support the local iron mining industry. Manufacturing activities were limited to the southwestern area of the Facility in a small section of the current NG, TNT, and Dynamite Areas. Operations are believed to have been limited to the higher topography of the western ridge or immediately adjacent to the ridge where wet areas were not present. Portions of the A-Line and Maintenance Areas were also used in support roles such as finished product storage (A-Line) and maintenance activities (Maintenance Area). These areas were either located on the western ridge, adjacent to the western ridge, or on well drained elevated ground.

In the years (1912 through 1919) leading up to and including World War I (WWI), the need for explosives and propellants increased greatly for both the United States (US) and its allies (Britain, France, and Russia). The US, Britain, and Russia each contracted Hercules to provide propellants and explosives for the WWI effort. As a result Hercules greatly expanded the manufacturing operations to include smokeless gunpowder, TNT, and both nitric and sulfuric acid at the Facility beginning in 1912 and ending in approximately 1914. The expansion coincided with the smokeless gunpowder manufacturing operations being performed at the US Army Picatinny Arsenal located only a few miles away from the Facility. In the WWI era most bulk transport of raw materials and finished products were accomplished by rail. Therefore, it was important to concentrate similar manufacturing operations critical to war time needs regionally to increase the efficiency of product delivery. It was also very important for the US government and its commercial counterparts to share technology and resources during

large production efforts. It is reported by the site historian (Mr. Harry Pascoe) that Picatinny Arsenal and the Facility routinely shared products and raw materials during this period.

Prior to this WWI expansion, the Facility it is believed surface elevations in many portions of Facility were in close proximity to the water table and thus were unsuitable for industrial development. It is also believed that there were numerous shallow ponds or seasonally wet areas present, similar to the present landscape encountered in the undeveloped Miscellaneous/Off-Site Area. Historic fill was used to increase grade, eliminate shallow ponds/wet areas, improve drainage, and increase compatibility of the soils to allow construction of large manufacturing complexes. Historic fill was also used extensively for establishing both narrow gauge and standard gauge rail beds. Narrow gauge rail was the primary vehicular conveyance system at the Facility for more than 75 years. Narrow gauge rail is substantially smaller standard gauge rail and can be moved or redirected quickly to meet the operational need. Standard gauge rail was used primarily for shipment of raw materials used in manufacture to the Facility and transport of finished propellant and explosive products to consumers. Standard gauge rail is capable of carrying more than 100-tons of product per rail car requiring a substantial rail bed to support the weight.

Hercules imported potentially large quantities of fly ash, bottom ash, and slag (historic fill) from local available sources that is believed to have possessed Metal and PAH constituents prior to entering the Facility. It is not certain but believed that the former iron foundries located in Dover, New Jersey, approximately four (4) miles east of the Facility, was the primary source of historic fill. Due to the very short period (1912 to 1914) of the large scale Facility expansion other unknown sources of historic fill may have been secured. It is most likely that fly-ash, bottom ash, and slag from on-site Facility boilers were added to the imported historic fill but likely represented a very small fraction of the total historic fill emplaced.

The facility is believed to have possessed a total of four powerhouses with associated coal fired boilers that supported previous manufacturing operations. Prior to the large

WWI expansion the powerhouses were relatively small (typically two boilers per powerhouse) and provided steam for areas immediately adjacent to the individual powerhouses. The small powerhouses were located in the current Dynamite, NG, Storage, and Maintenance Areas. The Maintenance Area power house was divided into two structures, each believed to have two boilers. A total of ten (10) small boilers are believed to be present at the Facility prior to the WWI expansion. The exact dates of construction or operation of the four small power houses are not known but may extend from the late 1800's through WWI (1919). Following WWI and after the major facility expansion was complete the four (4) small boilers were dismantled and replaced by a single large central powerhouse that produced both steam and electricity, and was located in the Maintenance Area.

5.5.1 Historic Fill Investigation

In order to better define the distribution and depth of historic fill across the Facility, a historic fill investigation was performed in spring 2003 within Areas I and III; specifically within the following former operational areas: Maintenance, AN, B-Line, Storage, Finishing, A-Line, and Development. The investigation was focused on these areas based on visual observations made during demolition efforts and routine site maintenance activities. Over 900 test pits were advanced on 100-ft. centers to a minimum depth of 4-ft. bgs. If historic fill was encountered, the test pits were advanced to a depth at least 2-ft. below the historic fill layer, regardless of total depth, to ensure multi level historic fill deposition was identified.

Test pits were not advanced within Area II and a small portion of the western Area III (immediately adjacent to Area I) because it was not yet determined at the time of the historic fill evaluation (spring 2003) if E&E constituents (primarily NG) were present at concentrations that could present an explosive hazard to field personnel. In particular, the historic fill was identified adjacent to former foundations and road/rail bases.

Historic fill test pit logs and photographs of each test pit are presented in Appendix E.

5.5.2 Historic Fill Distribution

The deposition of historic fill appears to be widespread within the former low lying areas of the Facility recovered during the 1912 to 1914 expansion. The former low lying areas are believed to be Area III and the southern/southwestern portion of Area I (Figure B-2). Within this area numerous isolated deposits of historic fill were observed. It is believed the areas of greatest historic fill deposition (greater than 1-ft.) likely represent previous areas of potentially ponded water or areas prone to shallow flooding that were recovered to expand industrial operations.

Historic fill is also present in the northeastern portion of the Facility within the Storage Area (Figure B-2). This was the former standard gauge rail entrance to the Facility. Standard gauge rail was used at the Facility to transport large quantities of raw materials and finished products to and from the Facility.

Significant quantities of historic fill were placed adjacent to the northern, western, and southern boundaries of Duck Pond (Figure B-2). It is believed that these areas may have been predominately wet and historic fill was used to reclaim the land for the following industrial operations:

- Northern area coincides with the Old Burning Ground (M5-3);
- Western area was formerly occupied by a dry house (L5-539) and a rest house (L6-2129). This area also contains a major road bounding Duck Pond;
- Southern area is the location of a major road bounding Duck Pond and was part of the standard gauge rail service to the Maintenance Area; and, immediately to the south of this area is a large disposal area (M8-1).

Demolition activities were performed in the Dynamite Area (Area II) prior to the historic fill evaluation by contract personnel specializing in demolition of potentially energetic structures. Since evaluation of historic fill was not the objective of the demolition efforts and documentation concerning exact thickness or areal extent was not recorded, Figure B-2 does not present estimations of historic fill within the Dynamite Area. However, based on visual observations made during demolition efforts historic fill is known to be present in close proximity to former Dynamite Area structures located within the former

wet areas of Area II. Additionally, historic fill was used as the base for the intricate network of roads and narrow gauge rail service throughout the Dynamite Area.

The total areal extent of historic fill at the Facility is estimated to be 161 acres.

5.5.3 Summary

The historic fill is likely composed to some small degree of fly ash, bottom ash, and slag generated from on-site boilers. However, due to the short duration of the major facility expansion from 1912 to 1914, the contribution from on-site boilers is believed to have been limited. The majority of the historic fill originated from off-site sources and is believed to have possessed Metal and PAH constituents prior to entering the Facility,.

Historic fill was used to increase grade, eliminate shallow ponds/wet areas, improve drainage, increase compatibility of the soils to allow construction of large manufacturing complexes, and create a suitable base for roads and narrow/standard gauge rail beds. Due to the unknown historic topography of the site (i.e. location of former ponds/wet areas) and the locations of former narrow gauge rails that changed over time, the distribution of the historic fill is widespread and heterogeneously distributed across the Facility. It is likely that historic fill will be encountered throughout the formerly developed portions of the Facility.

Analytical samples collected during the SI and RI within areas of known historic fill exhibit a wide range of detected constituent concentrations. The detected constituents and concentrations are similar to Table 4-2 of N.J.A.C 7:26E-4.6 Remedial Investigation of Landfills and Historic Fill Material (Summary of Target Contaminant Concentrations in Typical Historic Fill Material). However, the concentrations of detected historic fill constituents are not consistent (i.e. some locations exceed the RDCSCC and/or NRDCSCC and others do not). This tends to confirm that historic fill was secured from multiple off-site sources and emplaced at the Facility.

5.6. AREA I ANALYTICAL RESULTS

This section presents and evaluates the analytical results of the soil samples collected from Area I (B-Line, Development, Finishing, and Storage Areas), segregated by analytical group (Figure B-1). The following samples were collected:

- 1,533 horizontal and vertical delineation samples were collected within Area I from 1,193 SI/RI sample locations to delineate the horizontal and vertical extent of constituents present in soil exceeding the SCC.
 - o Horizontal Delineation Samples:
 - 887 samples were collected during the SI;
 - 878 samples were collected from AOC specific sample locations.
 - Nine sediment samples were collected (considered as soil for this RIR)
 - 303 samples were collected during the RI;
 - 202 samples were collected from AOC or grid based sample locations
 - 101 samples were collected from seven AOCs reserved for the RI.
 - o Vertical Delineation Samples:
 - No vertical delineation samples were collected during the SI;
 - 340 samples were collected during the RI from 280 locations;
 - 207 samples were collected from 180 AOC or grid based sample locations.
 - 133 samples were collected from 100 locations from seven AOCs reserved for the RI.
- Three samples were collected from three trenches to identify if any potential releases occurred at the historic hydraulic oil pipelines.

Soil samples collected during the SI were analyzed for portions of the PP+40 list (Refer to Appendix A Soils-SI) (Table B1-1). Soil samples collected during the RI (except for

the hydraulic oil pipeline trench samples) were analyzed for one or more of the following analytical groups based on SI exceedances: VOCs, SVOCs, Metals, E&E, and Total PCBs (Table B1-2). Soil samples collected from hydraulic oil pipeline trenches were utilized to determine potential hydraulic oil pipeline releases and were analyzed for BTEX and MTBE, PAHs and PHCs (Table B1-4).

Table B2-2 presents the site-wide RI sampling and analysis plan including IGWSCC, RDCSCC, and NRDCSCC exceedances by analytical group. Table B2-3 presents the complete set of comparisons of RI analytical results to the SCC. Table B2-4 presents a summary of the RI analytical results with SCC exceedances. Appendix B presents boring logs for all soil samples collected during the RI. Appendix C presents photographic logs for all test pits or trench excavations performed during the RI.

The following table presents a summary of Area I sample locations, number of samples, and IGWSCC exceedances by analytical group (VOCs, SVOCs, E&E, and Total PCBs).

Analytical Group	Number of Sample Locations	Number of Samples	Number of Samples with IGWSCC Exceedances	Number of Samples without IGWSCC Exceedances
VOCs	381	675	8	667
SVOCs	1132	1444	233	1211
E&E	1125	1433	83	1350
Total PCBs	325	619	1	618
Composite (Net)*	1193*	1533*	283*	1250*

Note: Metals do not have IGWSCC

*= The composite (net) numbers represent the total number of sample locations and number of samples collected. Most samples collected were analyzed for multiple analytical groups. Therefore, the composite (net) number of sample locations and number of samples is less than the sum of the sample locations and number of samples, respectively, of the analytical groups.

The following table presents a summary of Area I sample locations, number of samples, and RDCSCC and NRDCSCC exceedances by analytical group.

Analytical Group	Number of Sample Locations	Number of Samples**	Number of Samples with RDCSCC Exceedances	Number of Samples with NRDCSCC Exceedances	Number of Samples without RDCSCC/NRDCSCC Exceedances
VOCs	381	675	4	0	671
SVOCs	1132	1444	167	123	1277
Metals	931	1254	312	285	942
E&E	1125	1433	73	31	1360
Total PCBs	325	619	23	10	596
Composite (Net)*	1193*	1533*	454*	380*	1079*

*= The composite (net) numbers represent the total number of sample locations and number of samples collected. Most samples collected were analyzed for multiple analytical groups. Therefore, the composite (net) number of sample locations and number of samples is less than the sum of the sample locations and number of samples, respectively, of the analytical groups.

** Any sample that exceeds the less stringent NRDCSCC also exceeds the RDCSCC. In order to show all exceedances of a given criteria for a given analytical group, exceedances of the NRDCSCC appear in both exceedance columns. Therefore, the **Number of Samples**** in a row may be less than the sum of all exceedances and non-exceedances in that row.

The following table presents the estimated square footage of SCC exceedances by analytical group.

Analytical Group	Square Footage of IGWSCC Exceedances	Square Footage of RDCSCC Exceedances	Square Footage of NRDCSCC Exceedances
VOCs	73,795	30,636	0
SVOCs	1,410,241	1,052,334	671,839
Metals	NA	2,810,082	2,528,536
E&E	468,084	326,679	103,932
Total PCBs	3,576	219,134	42,534
Composite (Net)*	1,754,473	3,783,218	3,069,163

Note: Metals do not have IGWSCC

* = The composite (net) number represents the square footage of IGWSCC, RDCSCC, and NRDCSCC area exceedances incorporating all analytical groups within Area I. It is possible for an area exceedance to have identified more than one analytical group with constituents present at concentrations exceeding the IGWSCC, RDCSCC, or NRDCSCC. Therefore, the composite (net) number may not represent the sum of the square footage for each analytical group.

Within the areas identified in the table above, a total of two VOCs, 14 SVOCs, 12 Metals, 7 E&E, and Total PCBs were detected at concentrations exceeding the SCC, as presented below:

VOCs - IGWSCC Exceedances:

Constituent	UNITS	IGWSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of IGWSCC Exceedances	Concentration Range Min. - Max.
Benzene	UG/KG	1000	368	662	663	14	6	82 J-3780
MTLNCL	UG/KG	1000	378	672	673	11	2	81.3 J-2340 J

VOCs -RDCSCC/NRDCSCC Exceedances:

Constituent	UNITS	RDCSCC	NRDCSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of RDCSCC Exceedances	Number of NRDCSCC Exceedances	Concentration Range Min. - Max.
Benzene	UG/KG	3000	13000	368	662	663	14	4	0	82 J-3780

SVOCs - IGWSCC Exceedances:

Constituent	UNITS	IGWSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of IGWSCC Exceedances	Concentration Range Min. - Max.
DNP24	UG/KG	10000	972	1284	1285	4	1	69.18 J-14800
2,4/2,6-DNT	UG/KG	0.3	1125	1437	1437	232	230	16 J-264000 J
BZBF	UG/KG	50000	974	1286	1286	477	1	21 J-51000

Total PCBs	UG/KG	50000	325	619	619	119	1	4.3 J-58000

PCBs - RDCSCC/NRDCSCC Exceedances:

Constituent	UNITS	RDCSCC	NRDCSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of RDCSCC Exceedances	Number of NRDCSCC Exceedances	Concentration Range Min. - Max.
Total PCBs	UG/KG	490	2000	325	619	619	119	23	10	4.3 J-58000

5.6.1 AOCs Reserved for the RI

Seven AOCs located in Area I were not sampled as part of the Soils – SI and were reserved for the RI for investigation activities (Figure B-46). Table B2-1 presents the justification for reserving the AOCs for the RI. The following AOCs were reserved for the RI in Area I:

Former Operational Area	AOC (Soils-SI Designation)	AOC Name
Finishing	J7-1	Graphite Pond
Storage	J10-2166	D-2 Wax House
Development	K5-1	Former Drum Disposal Area
Development	K5-2	Pond
Development	M5-3	Old Burning Ground
B-Line	M8-1	Disposal Area
Storage	N6-1	Disposal Area

The horizontal and vertical limits of these samples are discussed below in Section 5.6.2 Discussion of Analytical Results.

5.6.2 Discussion of Analytical Results

The following section presents a summary and interpretation of the analytical results of the SI and RI soil sampling efforts. Results are organized by analytical group, and groups are further organized in bullet form by categories such as criteria comparison, extent of affected areas, and possible interactions with groundwater and surface water/sediment.

VOCs:

- The only VOC constituents detected at concentrations exceeding the IGWSCC were Benzene and Methylene Chloride (MTLNCL).
- The only VOC constituent detected at concentration exceeding the RDCSCC was Benzene.
- There were no VOC constituents detected at concentrations exceeding the NRDCSCC.
- The horizontal limits of soil samples with VOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent sample locations and are further defined by the physical boundary of the eastern ridge (Figure B-3).
- The vertical limits of soil samples with VOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent RI sample locations with the following exception (Figure B-3, Table B2-6):
 - o Soil sample J11-8570-01 collected from the southeastern portion of Grid J11.
- Areas with VOCs detected at concentrations exceeding the IGWSCC do not have associated Groundwater Quality Standards (GWQS) exceedances. The Revised Groundwater Site Investigation (GW-SI) Report and Volume C – Groundwater RIR present the groundwater investigation results.
- No soil samples with VOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC are located in close proximity to surface water features (Figure B-3). Therefore, VOCs in soil are not potential influences to surface water and sediments in this area.

SVOCs:

- The primary SVOC constituent detected at concentrations exceeding the IGWSCC is 2,4/2,6-DNT.
- The majority of SVOC constituents detected at concentrations exceeding the RDCSCC/NRDCSCC are PAHs commonly associated with historic fill.
- The horizontal limits of soil samples with SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent sample locations and are further defined by the physical boundary of the eastern ridge with the following exceptions (Figure B-6, Table B2-5):

- o Soil samples collected from the northeastern portion of Grid M11. Horizontal limits are not defined by analytical data in the southeastern direction. SVOCs in soil in this area are likely the result of a point source and it is not expected to extend beyond the identified area.
 - o Soil samples collected from the north portion of Grid R7 and western portion of Grid S7. Horizontal limits are not defined by analytical data in the southern direction.
- The vertical limits of soil samples with SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent RI sample locations with the following exceptions (Figure B-6, Table B2-6):
 - o Soil samples collected from the northeastern portion of Grid K6, northeastern portion of Grid L5, southwestern portion of Grid M5, and southern portion of Grid N6.
- Areas with SVOCs detected at concentrations exceeding the IGWSCC have limited GWQS exceedances of those SVOCs in groundwater samples, and thus do not significantly influence the quality of groundwater, with the following exception:
 - o Soil samples collected from the southern portion of Grid L10 and northern portion of Grid L11 indicate DNT at concentrations exceeding the IGWSCC. Groundwater samples collected from this area, specifically MW-27, indicate DNT at concentrations exceeding the GWQS, as illustrated in Volume C – Groundwater RIR.
- Soil samples with SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC located in close proximity to surface water features (Figure B-6) may locally affect the quality of surface water and sediments, although it is not the intent of this volume to fully characterize these interactions. Cross-media interactions are fully explored in Volume A of the RIR.
 - o Soil samples collected from the northeastern portion of Grid M7 indicate the presence of SVOCs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a miscellaneous pond.
 - o Soil samples collected from the eastern portion of Grid L5, northeastern portion of Grid L7, western portion of Grid M5, and southern portion of Grid M6 indicate the presence of SVOCs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to Duck Pond.
 - o Soil samples collected from the northern portion of Grid N5 indicate the presence of SVOCs at concentrations exceeding either the RDCSCC or

NRDCSCC and are located in close proximity to Shooting Pond and a miscellaneous pond.

- o Soil samples collected from the eastern portion of Grid K5, northern portion of Grid K6, and southwestern portion of Grid L5 indicate the presence of SVOCs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a miscellaneous pond.
- o Soil samples collected from the southern portion of Grids J5 and K5 indicate the presence of SVOCs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to the stream which feeds Duck Pond.
- o Soil samples collected from the northern and southwestern portions of Grid I6 indicate the presence of SVOCs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to the stream which enters the Facility south of the New Jersey Transit Railway (Grid I5) and is redirected through a culvert placed along Powder Mill Road.

Metals:

- There are no established IGWSCC standards for Metals.
- The primary metal constituents detected at concentrations exceeding the RDCSCC/NRDCSCC are Arsenic, Lead, and Thallium. Arsenic and Lead are commonly associated with historic fill.
- The horizontal limits of soil samples with Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent sample locations and are further defined by the physical boundary of the eastern ridge with the following exceptions (Figure B-9, Table B2-5):
 - o Soil samples collected from the northeastern portion of Grid M11. Horizontal limits are not defined by analytical data in the southeastern direction.
 - o Soil samples collected from the central portion of Grid R6 and northern portion of Grid R7. Horizontal limits are not defined by analytical data in the southern direction.
- The vertical limits of soil samples with Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent RI sample locations with the following exceptions (Figure B-9, Table B2-6):

- o Soil samples collected from the central portion of Grid J10, central portion of Grid M5, southeastern portion of Grid N5, southern and northern portions of Grid N6, and northern portion of Grid N7.
- Soil samples with Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC located in close proximity to surface water features (Figure B-9) may locally affect the quality of surface water and sediments, although it is not the intent of this volume to fully characterize these interactions. Cross-media interactions are fully explored in Volume A of the RIR.
 - o Soil samples collected from the northeastern portion of Grid M7 and central portion of Grid N7 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to miscellaneous ponds.
 - o Soil samples collected from the northeastern portion of Grid M7 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a miscellaneous pond.
 - o Soil samples collected from the southwestern portion of Grid N4 and northern portion of Grid N5 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to miscellaneous ponds.
 - o Soil samples collected from the eastern portion of Grid L5, and northeastern portion of Grid L6, central portion of Grid M5, and southern portion of M6 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to Duck Pond.
 - o Soil samples collected from the northern portion of Grid J6, southern portion of Grid K5, and western portion of Grid L5 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream which feeds Duck Pond and a miscellaneous pond.
 - o Soil samples collected from the eastern portion of Grid I5, southern portion of Grid I6, and southern portion of Grid H6 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream which enters the Facility south of the New Jersey Transit Railway (Grid I5) and is redirected through a culvert placed along Powder Mill Road.

E&E:

- The main E&E constituent detected at concentrations exceeding the IGWSCC is TNT.

- The primary E&E constituents detected at concentrations exceeding the RDCSCC/NRDCSCC are NC and NG.
- The horizontal limits of soil samples with E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent sample locations and are further defined by the physical boundary of the eastern ridge (Figure B-12).
- The vertical limits of soil samples with E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent RI sample locations (Figure B-12).
- Areas with E&E constituents detected at concentrations exceeding the IGWSCC have limited GWQS exceedances of those E&E constituents in groundwater samples, and thus do not significantly influence the quality of groundwater, with the following exception:
 - Soil samples collected from the northern portion of Grid L11 indicate TNT and DNT at concentrations exceeding the IGWSCC. Groundwater samples collected from this area, specifically MW-27, indicate TNT breakdown constituents (2-A-DNT, 4-A-DNT) and 2,4/2,6-DNT at concentrations exceeding the GWQS, as illustrated in Volume C – Groundwater RIR.
- Soil samples with E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC located in close proximity to surface water features (Figure B-12) may locally affect the quality of surface water and sediments, although it is not the intent of this volume to fully characterize these interactions. Cross-media interactions are fully explored in Volume A of the RIR.
 - Soil samples collected from the central portion of Grid N7 indicate the presence of E&E constituents at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a miscellaneous pond.
 - Soil samples collected from the southeastern portion of Grid L5 and western portion of Grid M5 indicate the presence of E&E constituents at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to Duck Pond.

PCBs:

- There was only one sample with detected concentrations of Total PCBs exceeding the IGWSCC.
- From the total of 577 Total PCB samples collected, only 23 samples detected concentrations exceeding the RDCSCC and only 10 samples detected concentrations exceeding the NRDCSCC.

- The horizontal limits of soil samples with Total PCBs detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent sample locations and are further defined by the physical boundary of the eastern ridge (Figure B-15).
- The vertical limits of soil samples with Total PCBs detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent RI sample locations (Figure B-15).
- The area with Total PCBs detected at concentrations exceeding the IGWSCC has no GWQS exceedance for Total PCBs in groundwater samples, and thus does not influence the quality of groundwater (Refer to Volume C – Groundwater RIR).
- Soil samples with Total PCBs detected at concentrations exceeding either the RDCSCC or NRDCSCC located in close proximity to surface water features (Figure B-15) may locally affect the quality of surface water and sediments, although it is not the intent of this volume to fully characterize these interactions. Cross-media interactions are fully explored in Volume A of the RIR.
 - Soil samples collected from the southeastern portion of Grid H6 indicate the presence of Total PCBs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to the stream which enters the Facility south of the New Jersey Transit Railway (Grid I5) and is redirected through a culvert placed along Powder Mill Road.
 - Soil samples collected from the southwestern portion of Grid K5 indicate the presence of Total PCBs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream which feeds Duck Pond.
 - Soil samples collected from the northwestern portion of Grid K6 indicate the presence of Total PCBs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a miscellaneous pond.
 - Soil samples collected from the southeastern portion of Grid L5 indicate the presence of Total PCBs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to Duck Pond.

5.6.3 Hydraulic Oil Pipeline Investigation

Three soil samples were collected from three trenches excavated in B-Line (SB-R-TR-06/07/08) (Figure B-1). One soil sample was collected from each trench. No BTEX, MTBE, PAHs, or PHCs were identified by laboratory analysis at concentrations

exceeding the SCC (Table B5-5). The results of the fingerprint scan for SB-R-TR-06/07/08 did not identify the presence of hydraulic oil or PHCs.

5.6.4 Recently Identified AOCs Not Previously Investigated

Seven additional AOCs (debris areas) were identified within Area I during implementation of RI field activities (Figure B-46). These areas appear to have been historically low-lying isolated portions of the Facility that were filled with debris (historic fill, scrap steel/iron, and general refuse). During the RI, test pits were excavated within the center of the anticipated AOC boundary to visually classify the lithology and debris material. Test pit logs are presented in Appendix B and photos are presented in Appendix C.

The intention of the test pits was to provide a preliminary assessment of the nature of the debris present within each area. The recently identified debris areas will be addressed in the future actions work plan included in Volume A.

5.6.5 Area I Summary

The following section provides a summary of the results presented above.

- Soils with constituents detected at concentrations exceeding the IGWSCC show a very limited connection to groundwater quality; with the following exception:
 - Soil samples collected from the southern portion of Grid L10 and northern portion of Grid L11 indicate 2,4/2,6-DNT, TNT at concentrations exceeding the IGWSCC. Groundwater samples collected from this area, specifically MW-27, indicate TNT breakdown constituents (2-A-DNT, 4-A-DNT) and 2,4/2,6-DNT at concentrations exceeding the GWQS, as illustrated in Volume C – Groundwater RIR.
- VOCs were detected at concentrations exceeding either the RDCSCC/NRDCSCC at very few sample locations and do not represent a significant environmental condition. The source for the VOCs is believed to be historic small single release events (likely attributed to maintenance activities).
- SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are comprised primarily of PAH constituents. These constituents are primarily associated with the historically common practice of using fly ash, bottom ash, and slag as fill material (historic fill) to improve the grade of the

Facility, recover unusable land, and establish numerous narrow gauge rail beds. To a lesser extent, these constituents are associated with historic manufacturing operations where these exceedances do not occur within the historic fill contour.

- 2,4/2,6-DNT (SVOC) detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are associated with historic manufacturing operations.
- Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are primarily associated with the historically common practice of using fly ash, bottom ash, and slag as fill material. To a lesser extent, these constituents are associated with historic manufacturing operations where these exceedances do not occur within the historic fill areal extent contour.
- E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are associated with historic manufacturing operations.
- Total PCBs detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are potentially associated with disposal areas and isolated transformers.
- The following table presents a summary of the number of samples with SCC exceedances and exceedance percentages:

Number of Locations	Number of Samples	Samples with IGWSCC Exceedances	Samples with RDCSCC Exceedances	Samples with NRDCSCC Exceedances	Percentage of Samples with IGWSCC Exceedances	Percentage of Samples with RDCSCC Exceedances	Samples with NRDCSCC Exceedances
1193	1533	283	454	380	18.50%	30%	25%

5.7. AREA II ANALYTICAL RESULTS

This section presents and evaluates the analytical results of the soil samples collected from Area II (Dynamite, TNT, PETN, and NG Areas), segregated by analytical group (Figure B-1). The following samples were collected:

- 904 horizontal and vertical delineation samples were collected within Area II from 680 SI/RI sample locations to delineate the horizontal and vertical extent of constituents present in soil exceeding the SCC.

o Horizontal Delineation Samples:

➤ 490 samples were collected during the SI;

- 477 samples were collected from AOC specific sample locations.

- 13 sediment samples were collected (considered as soil for this RIR)
- 190 samples were collected during the RI;
 - 116 samples were collected from AOC or grid based sample locations
 - 74 samples were collected from 25 AOCs reserved for the RI.
- o Vertical Delineation Samples:
 - Three vertical delineation samples were collected during the SI;
 - 221 samples were collected during the RI from 184 locations;
 - 118 samples were collected from 110 AOC or grid based sample locations.
 - 103 samples were collected from 74 locations from 25 AOCs reserved for the RI.

Soil samples collected during the SI were analyzed for portions of the PP+40 list (Refer to Appendix A Soils-SI) (Table B1-1). Soil samples collected during the RI (except for the hydraulic oil pipeline trench samples) were analyzed for one or more of the following analytical groups based on SI exceedances: VOCs, SVOCs, Metals, E&E, and Total PCBs (Table B1-2).

Table B3-2 presents the site-wide RI sampling and analysis plan including IGWSCC, RDCSCC, and NRDCSCC exceedances by analytical group. Table B3-3 presents complete the set of comparisons of RI analytical results to the SCC. Table B3-4 presents a summary of the RI analytical results with SCC exceedances. Appendix B presents boring logs for all soil samples collected during the RI. Appendix C presents photographic logs for all test pits or trench excavations performed during the RI.

The following table presents a summary of Area II sample locations, number of samples, and IGWSCC exceedances by analytical group (VOCs, SVOCs, E&E, and Total PCBs).

Analytical Group	Number of Sample Locations	Number of Samples	Number of Samples with IGWSCC Exceedances	Number of Samples without IGWSCC Exceedances
VOCs	206	343	1	342
SVOCs	661	864	157	707
E&E	652	852	183	669
Total PCBs	136	272	0	272
Composite (Net)*	680*	904*	241*	663*

Note: Metals do not have IGWSCC

*= The composite (net) numbers represent the total number of sample locations and number of samples collected. Most samples collected were analyzed for multiple analytical groups. Therefore, the composite (net) number of sample locations and number of samples is less than the sum of the sample locations and number of samples, respectively, of the analytical groups.

The following table presents a summary of Area II sample locations, number of samples, and RDCSCC and NRDCSCC exceedances by analytical group.

Analytical Group	Number of Sample Locations	Number of Samples**	Number of Samples with RDCSCC Exceedances	Number of Samples with NRDCSCC Exceedances	Number of Samples without RDCSCC/NRDCSCC Exceedances
VOCs	206	343	0	0	343
SVOCs	661	864	97	68	767
Metals	580	769	179	158	590
E&E	652	852	59	43	793
Total PCBs	136	272	2	0	270
Composite (Net)*	680*	904*	259*	217*	645*

*= The composite (net) numbers represent the total number of sample locations and number of samples collected. Most samples collected were analyzed for multiple analytical groups. Therefore, the composite (net) number of sample locations and number of samples is less than the sum of the sample locations and number of samples, respectively, of the analytical groups.

** Any sample that exceeds the less stringent NRDCSCC also exceeds the RDCSCC. In order to show all exceedances of a given criteria for a given analytical group, exceedances of the NRDCSCC appear in both exceedance columns. Therefore, the **Number of Samples**** in a row may be less than the sum of all exceedances and non-exceedances in that row.

The following table presents the square footage of SCC exceedances by analytical group.

Analytical Group	Square Footage of IGWSCC Exceedances	Square Footage of RDCSCC Exceedances	Square Footage of NRDCSCC Exceedances
VOCs	319	0	0
SVOCs	719,423	438,138	275,166
Metals	NA	1,294,885	1,147,815

Analytical Group	Square Footage of IGWSCC Exceedances	Square Footage of RDCSCC Exceedances	Square Footage of NRDCSCC Exceedances
E&E	740,820	276,076	190,716
Total PCBs	0	60,187	0
Composite (Net)*	1,031,907	1,710,131	1,385,930

Note: Metals do not have IGWSCC

* = The composite (net) number represents the square footage of IGWSCC, RDCSCC, and NRDCSCC area exceedances incorporating all analytical groups within Area I. It is possible for an area exceedance to have identified more than one analytical group with constituents present at concentrations exceeding the IGWSCC, RDCSCC, or NRDCSCC. Therefore, the composite (net) number may not represent the sum of the square footage for each analytical group.

Within the areas identified in the table above, a total of one VOC, 11 SVOCs, six Metals, seven E&E, and Total PCBs were detected at concentrations exceeding the SCC, as presented below:

VOCs - IGWSCC Exceedances:

Constituent	UNITS	IGWSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of IGWSCC Exceedances	Concentration Range Min. - Max.
MTLNCL	UG/KG	1000	206	343	343	4	1	560 J-2630

SVOCs - IGWSCC Exceedances:

Constituent	UNITS	IGWSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of IGWSCC Exceedances	Concentration Range Min. - Max.
DNP24	UG/KG	10000	642	844	845	2	1	560 J-2630
2,4/2,6-DNT	UG/KG	0.3	654	856	857	158	157	20 J-14000000

SVOCs - RDCSCC/NRDCSCC Exceedances:

Constituent	UNITS	RDCSCC	NRDCSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of RDCSCC Exceedances	Number of NRDCSCC Exceedances	Concentration Range Min. - Max.
2,4/2,6-DNT	UG/KG	940	4200	654	856	857	158	60	35	20 J-14000000
BZD	UG/KG	2	8	465	467	468	4	4	4	33.3 J-177 J
BZAA	UG/KG	900	4000	642	844	845	260	25	7	28 J-13000
BZAP	UG/KG	660	660	642	844	845	257	32	32	23 J-9700
BZBF	UG/KG	900	4000	642	844	845	241	35	8	40 J-16100
BZKF	UG/KG	900	4000	636	838	839	136	15	1	36 J-4500 J
BIS2EHP	UG/KG	49000	210000	642	844	845	213	1	0	17 J-57000 #D
Chrysene	UG/KG	9000	40000	642	844	845	263	1	0	35 J-9900
DBAHA	UG/KG	660	660	642	844	845	64	3	3	41 J-2200 J
INP123	UG/KG	900	4000	642	844	845	142	15	3	44 J-6000 J

Metals - RDCSCC/NRDCSCC Exceedances:

Constituent	UNITS	RDCSCC	NRDCSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of RDCSCC Exceedances	Number of NRDCSCC Exceedances	Concentration Range Min. - Max.
Antimony	MG/KG	14	340	580	769	770	203	3	0	0.16 BN-27 N
Arsenic	MG/KG	20	20	580	769	770	741	74	74	0.896 J-420
Copper	MG/KG	600	600	580	769	770	766	7	7	0.443 J-48500
Lead	MG/KG	400	600	580	769	770	769	106	84	1.15 J-93300 J
Thallium	MG/KG	2	2	580	769	770	81	23	23	0.38 B-3.4
Zinc	MG/KG	1500	1500	580	769	770	768	9	9	1.90 J-27700 N

Note: Metals do not have IGWSCC

E&E - IGWSCC Exceedances:

Constituent	UNITS	IGWSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of IGWSCC Exceedances	Concentration Range Min. - Max.
DNB13	UG/KG	20	427	626	627	60	58	110 J-120000
TNT	UG/KG	40	427	626	627	169	168	56.2 J-120000000 J
2-A-DNT	UG/KG	40	427	626	627	126	117	110 J-66000 J

E&E - RDCSCC/NRDCSCC Exceedances:

Constituent	UNITS	RDCSCC	NRDCSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of RDCSCC Exceedances	Number of NRDCSCC Exceedances	Concentration Range Min. - Max.
DNB13	UG/KG	7800	100000	427	626	627	60	7	1	110 J-120000
TNT	UG/KG	21000	95000	427	626	627	169	54	43	56.2 J-120000000 J

NG	UG/KG	46000	200000	448	647	652	93	17	2	2000 J-476000000 J

PCBc - RDCSCC/NRDCSCC Exceedances:

Constituent	UNITS	RDCSCC	NRDCSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of RDCSCC Exceedances	Number of NRDCSCC Exceedances	Concentration Range Min. - Max.
Total PCBs	UG/KG	490	2000	136	272	272	37	2	0	4.2 J-1800 J

5.7.1 AOCs Reserved for the RI

Twenty-five AOCs located in Area II were not sampled as part of the Soils – SI and were reserved for the RI for investigation activities (Figure B-46). Table B3-1 presents the justification for reserving the AOCs for the RI. The table below presents a list of AOCs reserved for the RI by former operational area.

Former Operational Area	AOC (Soils-SI Designation)	AOC Name
TNT	A11-2	Mixed Acid Storage #3
TNT	A11-4	Acid Fortifier #2
TNT	A11-5	Bi/Trinitrator #2
TNT	A11-504	Weak Acid Storage Tanks
TNT	A11-7	Nitric Acid Storage #2
TNT	A12-1	TNT in Soil
TNT	A12-426	Block Breaker
TNT	A13-625	Filter House #2
TNT	B10-2	TNT in Soil
TNT	B10-5	Possible Catch Tank for B10-508/B10-509
TNT	B10-501	Nitric Acid Storage #1
TNT	B10-502	Mixed Acid Storage Tanks #1
TNT	B10-505	Acid Fortifier
TNT	B10-508	Bi/Trinitrator #1
TNT	B10-509	Neutralizer/Pelletizer #1
TNT	B10-6	TNT in Soil
TNT	B12-1	Perchlorate Grinder
TNT	B12-234	Filter House #1 Sump
TNT	B13-1	Settling Pond
TNT	B13-2	Gravel Pit
TNT	C10-439	Weak Acid Storage Tanks
Dynamite	C13-666	Refined Graining House
NG	C11-8572C	Storage Shed
NG	C11-8572D	Instrument Room
NG	D11-2031	DNT Heater House

The horizontal and vertical limits of these samples are discussed below in Section 5.7.2 Discussion of Analytical Results.

5.7.2 Discussion of Analytical Results

The following section presents a summary and interpretation of the analytical results of the SI and RI soil sampling efforts. Results are organized by analytical group, and groups are further organized in bullet form by categories such as criteria comparison, extent of affected areas, and possible interactions with groundwater and surface water/sediment.

VOCs:

- The only VOC constituent detected at a concentration exceeding the IGWSCC was MTLNCL.
- There were no VOC constituents detected at concentrations exceeding the RDCSCC or the NRDCSCC.
- Areas with VOCs detected at concentrations exceeding the IGWSCC do not have associated GWQS exceedances. The Revised GW- SI Report and Volume C – Groundwater RIR present the groundwater investigation results.
- No soil samples with VOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC are located in close proximity to surface water features (Figure B-4). Therefore, VOCs in soil are not potential influences to surface water and sediments in this area.

SVOCs:

- The primary SVOC constituent detected at concentrations exceeding the IGWSCC is 2,4/2,6-DNT.
- The majority of SVOC constituents detected at concentrations exceeding the RDCSCC/NRDCSCC are PAHs commonly associated with historic fill.
- The horizontal limits of soil samples with SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent sample locations and are further defined by the physical boundary of the western ridge with the following exception (Figure B-7, Table B3-5):
 - o Soil samples collected from the central portion of Grid E16 and the northeast portion of Grid G14. Horizontal limits are not defined by analytical data in the eastern direction.

- o Soil samples collected from the northeast portion of Grid G14. Horizontal limits are not defined by analytical data in the southeastern direction.
- The vertical limits of soil samples with SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent RI sample locations with the following exceptions (Figure B-7, Table B3-6):
 - o Soil samples collected from the northwestern and southwestern portions of Grid B13, the central portion of Grids B12 and B10, and the northeastern portion of Grid A11, A12, and D11.
- Areas with SVOCs detected at concentrations exceeding the IGWSCC have limited GWQS exceedances of those SVOCs in groundwater samples, and thus do not significantly influence the quality of groundwater; with the following exception:
 - o Soil samples collected from the northwestern portion of Grid B11 and indicate DNT at concentrations exceeding the IGWSCC. Groundwater samples collected from this area, specifically MW-47, indicate 2,4/2,6-DNT at concentrations exceeding the GWQS, as illustrated in Volume C – Groundwater RIR.
- Soil samples with SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC located in close proximity to surface water features (Figure B-7) may locally affect the quality of surface water and sediments, although it is not the intent of this volume to fully characterize these interactions. Cross-media interactions are fully explored in Volume A of the RIR.
 - o Soil samples collected from the southern portion of Grid D11 and C11 and the western portion of Grid E11 indicate the presence of SVOCs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream that drains to the unnamed pond in the dynamite area. This pond is part of the central drainage area.
 - o Soil samples collected from the southern portion of Grid D13 indicate the presence of SVOCs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to the unnamed pond in the dynamite area. This pond is part of the central drainage area.

Metals:

- There are no established IGWSCC standards for Metals.
- The primary metal constituents detected at concentrations exceeding the RDCSCC/NRDCSCC are Arsenic, Lead, and Thallium. Arsenic and Lead are commonly associated with historic fill.

- The horizontal limits of soil samples with Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent sample locations and are further defined by the physical boundary of the western ridge (Figure B-10, Table B3-5).
- The vertical limits of soil samples with Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent RI sample locations with the following exceptions (Figure B-10, Table B3-6):
 - Soil samples collected from the southwestern portion of Grid C9, and the southern portion of Grid B10
 - Soil samples collected from the east central portion of Grid C11
 - Soil samples collected from the central portion of Grid A11.
- Soil samples with Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC located in close proximity to surface water features (Figure B-10) have the potential to locally affect the quality of surface water and sediments, although it is not the intent of this volume to fully characterize these interactions. Cross-media interactions are fully explored in Volume A of the RIR.
 - Soil samples collected from Grids C11 and the northwestern portion of D11 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream which drains to the unnamed pond in the dynamite area. This pond is part of the central drainage area.
 - Soil samples collected from the southern portion of Grid D11 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream which drains to the unnamed pond in the dynamite area. This pond is part of the central drainage area.
 - Soil samples collected from the northeastern portion of Grid E11 and the western portion of Grid F11 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a miscellaneous pond. This pond is part of the central drainage area.
 - Soil samples collected from the northern portion of Grid D14 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to the unnamed pond in the dynamite area. This pond is part of the central drainage area.

E&E:

- The primary E&E constituents detected at concentrations exceeding the IGWSCC are TNT and 2-A-DNT.
- The primary E&E constituents detected at concentrations exceeding the RDCSCC/NRDCSCC are TNT, 4-A-DNT and 2-A-DNT.
- The horizontal limits of soil samples with E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent sample locations and are further defined by the physical boundary of the western ridge (Figure B-13).
- The vertical limits of soil samples with E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent RI sample locations (Figure B-13) with the following exceptions.
 - Soil samples collected from the eastern portion of Grid B10, the eastern and southern portions of Grid A11, the southwestern portion of Grid B13 and the southeastern portion of Grid C13.
- Areas with E&E constituents detected at concentrations exceeding the IGWSCC have limited GWQS exceedances of those E&E constituents in groundwater samples, and thus do not significantly influence the quality of groundwater, with the following exceptions.
 - Soil samples collected from the PETN Area, the TNT Area and the western Dynamite and NG Areas including Grids A11, A12, A13, B10, B11, B12, B13, B14, C13, C14, D13 and D14. Soil samples from these areas indicate E&E constituents at concentrations exceeding the IGWSCC. Groundwater samples collected from these areas, indicate TNT, TNT breakdown constituents (2-A-DNT, 4-A-DNT), 2,4/2,6-DNT, and NG at concentrations exceeding the GWQS, as illustrated in Volume C – Groundwater RIR.
- Soil samples with E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC located in close proximity to surface water features (Figure B-13) have the potential to locally affect the quality of surface water and sediments, although it is not the intent of this volume to fully characterize these interactions. Cross-media interactions are fully explored in Volume A of the RIR.
 - Soil samples collected from the northern portion of Grid D14 indicate the presence of E&E constituents at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to the unnamed pond in the Dynamite Area. This pond is in the central drainage area.

- o Soil samples collected from the southwestern portion of Grid C13 indicate the presence of E&E constituents at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream which is part of the western drainage area.

PCBs:

- There were no samples with detected concentrations of Total PCBs exceeding the IGWSCC.
- There were only two samples detected concentrations exceeding the RDCSCC and no samples detected concentrations exceeding the NRDCSCC.
- The horizontal limits of soil samples with Total PCBs detected at concentrations exceeding the RDCSCC are defined by RDCSCC compliance at adjacent sample locations and are further defined by the physical boundary of the western ridge (Figure B-16).
- The vertical limits of soil samples with Total PCBs detected at concentrations exceeding the RDCSCC are defined by RDCSCC compliance at the deepest intervals at those RI sample locations (Figure B-16).
- There are no soil samples with Total PCBs detected at concentrations exceeding the RDCSCC located in close proximity to surface water features; Total PCBs in soil do not influence the quality of sediment and surface water in Area II.

5.7.3 Area II Summary

The following section provides a summary of the results presented above.

- Soils with constituents detected at concentrations exceeding the IGWSCC show a connection to groundwater quality in the TNT Area, the PETN Area, and the western Dynamite and NG Areas. Groundwater samples taken in these areas indicate TNT, TNT breakdown constituents (2-A-DNT, 4-A-DNT), 2,4/2,6-DNT and NG exceeding the GWQS, as illustrated in Volume C – Groundwater RIR.
- Soils in the remainder of Area II (eastern NG and Dynamite Areas) with E&E constituents exceeding the IGWSCC do not correlate to GWQS exceedances for those E&E constituents in groundwater samples, and thus do not significantly influence the quality of groundwater.
- VOCs were not detected at concentrations exceeding either the RDCSCC/NRDCSCC at any sample locations in Area II.
- SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are comprised primarily of PAH constituents. These constituents are primarily associated with the historically common practice of using fly ash,

bottom ash, and slag as fill material. To a lesser extent, these constituents are considered associated with historic manufacturing operations where these exceedances do not occur within the historic fill contour mapped during the RI.

- 2,4/2,6-DNT (SVOC) detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility is associated with historic manufacturing operations.
- Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are primarily associated with the historically common practice of using fly ash, bottom ash, and slag as fill material. To a lesser extent, these constituents are considered associated with historic manufacturing operations where these exceedances do not occur within the historic fill contour mapped during the RI.
- E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are associated with historic manufacturing operations.
- Total PCBs detected at concentrations exceeding the RDCSCC at the Facility are potentially associated with isolated transformers.
- The following table presents a summary of the number of samples with SCC exceedances and exceedance percentages in Area II:

Number of Locations	Number of Samples	Samples with IGWSCC Exceedances	Samples with RDCSCC Exceedances	Samples with NRDCSCC Exceedances	Percentage of Samples with IGWSCC Exceedances	Percentage of Samples with RDCSCC Exceedances	Percentage of Samples with NRDCSCC Exceedances
680	904	241	259	217	27%	29%	24%

5.8. AREA III ANALYTICAL RESULTS

This section presents and evaluates the analytical results of the soil samples collected from Area III (A-Line, Maintenance, AN, Diazo, and Western Development Areas), segregated by analytical group (Figure B-1). The following samples were collected:

- 872 horizontal and vertical delineation samples were collected within Area III from 749 SI/RI sample locations to delineate the horizontal and vertical extent of constituents present in soil exceeding the SCC.
 - Horizontal Delineation Samples:
 - 634 samples were collected during the SI;

- 627 samples were collected from AOC specific sample locations.
- Seven sediment samples were collected (considered as soil for this RIR)
- 110 samples were collected during the RI;
 - 77 samples were collected from AOC or grid based sample locations
 - 23 samples were collected from 12 AOCs reserved for the RI.
 - 10 samples were collected from DDNP Ponds.
- o Vertical Delineation Samples:
 - No vertical delineation samples were collected from this area during the SI;
 - 123 samples were collected during the RI from 108 locations;
 - 82 samples were collected from 75 AOC or grid based sample locations.
 - 28 samples were collected from 23 locations from 12 AOCs reserved for the RI.
 - 13 samples were collected from DDNP Ponds.
- Five samples were collected from four trenches to identify if any potential releases occurred at the historic hydraulic oil pipelines.

Soil samples collected during the SI were analyzed for portions of the PP+40 list (Refer to Appendix A Soils-SI) (Table B1-1). Soil samples collected during the RI (except for DDNP Pond and hydraulic oil pipeline trench samples) were analyzed for one or more of the following analytical groups based on SI exceedances: VOCs, SVOCs, Metals, E&E, and Total PCBs (Table B1-2). Soil samples collected from DDNP Pond locations were analyzed for PP+40 SVOCs, E&E, and DDNP (Table B1-3). Soil samples collected from hydraulic oil pipeline trenches were utilized to determine potential hydraulic oil pipeline releases and were analyzed for BTEX and MTBE, PAHs and PHCs (Table B1-4).

Tables B4-2, B5-2, and B5-3 present the site-wide RI sampling and analysis plans including IGWSCC, RDCSCC, and NRDCSCC exceedances by analytical group. Tables B4-3, B5-4, and B5-5 present complete the set of comparisons of RI analytical results to the SCC. Tables B4-4, B5-6, and B5-7 present a summary of the RI analytical results with SCC exceedances. Appendix B presents boring logs for all soil samples collected during the RI. Appendix C presents photographic logs for all test pits or trench excavations performed during the RI.

The following table presents a summary of Area III sample locations, number of samples, and IGWSCC exceedances by analytical group (VOCs, SVOCs, E&E, and Total PCBs).

Analytical Group	Number of Sample Locations	Number of Samples	Number of Samples with IGWSCC Exceedances	Number of Samples without IGWSCC Exceedances
VOCs	236	326	8	318
SVOCs	722	836	166	670
E&E	707	822	52	770
Total PCBs	165	255	1	254
Composite (Net)*	749*	872*	197*	675*

Note: Metals do not have IGWSCC

*= The composite (net) numbers represent the total number of sample locations and number of samples collected. Most samples collected were analyzed for multiple analytical groups. Therefore, the composite (net) number of sample locations and number of samples is less than the sum of the sample locations and number of samples, respectively, of the analytical groups.

The following table presents a summary of Area III sample locations, number of samples, and RDCSCC and NRDCSCC exceedances by analytical group.

Analytical Group	Number of Sample Locations	Number of Samples**	Number of Samples with RDCSCC Exceedances	Number of Samples with NRDCSCC Exceedances	Number of Samples without RDCSCC/NRDCSCC Exceedances
VOCs	236	326	3	0	323
SVOCs	722	836	124	88	712
Metals	619	715	241	222	474
E&E	707	822	47	18	775
Total PCBs	165	255	26	9	229
Composite (Net)*	749*	872*	325*	268*	547*

*= The composite (net) numbers represent the total number of sample locations and number of samples collected. Most samples collected were analyzed for multiple analytical groups. Therefore, the composite (net) number of sample locations and number of samples is less than the sum of the sample locations and number of samples, respectively, of the analytical groups.

** Any sample that exceeds the less stringent NRDCSCC also exceeds the RDCSCC. In order to show all exceedances of a given criteria for a given analytical group, exceedances of the NRDCSCC appear in both exceedance columns. Therefore, the **Number of Samples**** in a row is less than the sum of all exceedances and non-exceedances in that row.

The following table presents the square footage of SCC exceedances by analytical group.

Analytical Group	Square Footage of IGWSCC Exceedances	Square Footage of RDCSCC Exceedances	Square Footage of NRDCSCC Exceedances
VOCs	25,409	20,860	0
SVOCs	821,995	697,811	419,833
Metals	NA	1,488,925	1,385,154
E&E	277,288	173,301	59,395
Total PCBs	8,719	391,800	73,814
Composite (Net)*	989,129	2,128,029	1,667,188

Note: Metals do not have IGWSCC

* = The composite (net) number represents the square footage of IGWSCC, RDCSCC, and NRDCSCC area exceedances incorporating all analytical groups within Area I. It is possible for an area exceedance to have identified more than one analytical group with constituents present at concentrations exceeding the IGWSCC, RDCSCC, or NRDCSCC. Therefore, the composite (net) number may not represent the sum of the square footage for each analytical group.

Within the areas identified in the table above, a total of five VOCs, 13 SVOCs, nine Metals, seven E&E, and Total PCBs were detected at concentrations exceeding the SCC, as presented below:

VOCs - IGWSCC Exceedances:

Constituent	UNITS	IGWSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of IGWSCC Exceedances	Concentration Range Min. - Max.
ACRN	UG/KG	1000	206	296	296	1	1	1370 J-1370 J
Benzene	UG/KG	1000	220	310	310	13	2	110 J-8000
CLBZ	UG/KG	1000	215	305	305	1	1	4500-4500
MTLNCL	UG/KG	1000	231	321	321	7	3	31.1 J-2861 B
TCE	UG/KG	1000	125	125	125	13	1	180 J-2100 J

VOCs - RDCSCC/NRDCSCC Exceedances:

Constituent	UNITS	RDCSCC	NRDCSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of RDCSCC Exceedances	Number of NRDCSCC Exceedances	Concentration Range Min. - Max.
ACRN	UG/KG	1000	5000	206	296	296	1	1	0	1370 J-1370 J
Benzene	UG/KG	3000	13000	220	310	310	13	2	0	110 J-8000

SVOCs - IGWSCC Exceedances:

Constituent	UNITS	IGWSCC	Number of Locations	Number of Samples	Number of Analysis	Number of Detections	Number of IGWSCC Exceedances	Concentration Range Min. - Max.
DCBZ14	UG/KG	100000	689	803	809	1	1	330000-330000
2,4/2,6-DNT	UG/KG	0.3	707	821	825	164	164	20 J-115300 *D

5.8.1 AOCs Reserved for the RI

Twelve AOCs located in Area III were not sampled as part of the Soils – SI and were reserved for the RI for investigation activities (Figure B-46). Table B4-1 presents the justification for reserving the AOCs for the RI. The following AOCs were reserved for the RI:

Former Operational Area	AOC (Soils-SI Designation)	AOC Name
Diazo	H8-1	DDNP Ponds
Diazo	H8-584	Can Stop Paint Shop
Maintenance	G9-4	Buried Drum Area
Maintenance	H11-1	Former Burning Ground
A-Line	E9-1	Store House
A-Line	E9-2119	Dry House
A-Line	E9-2337	100-ft. Dryer
A-Line	F10-2094	NC Weigh House
A-Line	G8-2110	Cut Powder Store
AN	H12-237	Former Burning Ground
AN	H13-1	Unknown Name
AN	H13-7	Stressed Vegetation

Samples collected from the former Diazo ponds (H8-1 and H8-584) were analyzed for a unique analyte list that contained an extended SVOC and E&E constituent list including DDNP. For the purpose of sample identification, the samples all were named using the H8-1 site designation. The horizontal and vertical limits of samples from AOCs reserved for the RI are discussed below in Section 5.8.2 Discussion of Analytical Results.

5.8.2 Discussion of Analytical Results

The following section presents a summary and interpretation of the analytical results of the SI and RI soil sampling efforts. Results are organized by analytical group, and groups are further organized in bullet form by categories such as criteria comparison, extent of affected areas, and possible interactions with groundwater and surface water/sediment.

VOCs:

- The primary VOC constituents detected at concentrations exceeding the IGWSCC are Benzene and MTLNCL.

- The only VOC constituents detected at concentration exceeding the RDCSCC were ACRN and Benzene.
- There were no VOC constituents detected at concentrations exceeding the NRDCSCC.
- The horizontal limits of soil samples with VOCs detected at concentrations exceeding the RDCSCC are defined by RDCSCC compliance at adjacent sample locations (Figure B-5).
- There are no exceedances of the RDCSCC from vertical samples in Area III.
- Areas with VOCs detected at concentrations exceeding the IGWSCC do not have associated GWQS exceedances. The Revised GW- SI Report and Volume C – Groundwater RIR present the groundwater investigation results.
- No soil samples with VOCs detected at concentrations exceeding the RDCSCC or are located in close proximity to surface water features (Figure B-5). Therefore, VOCs in soil are not potential influences to surface water and sediments in Area III.

SVOCs:

- The primary SVOC constituent detected at concentrations exceeding the IGWSCC is 2,4/2,6-DNT.
- The majority of SVOC constituents detected at concentrations exceeding the RDCSCC/NRDCSCC are PAHs commonly associated with historic fill.
- The horizontal limits of soil samples with SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent sample locations and are further defined by the physical boundaries of the eastern and western ridges with the following exception (Figure B-8, Table B4-5):
 - Soil samples collected from the central portion of Grid G6 and the northwestern portion of H6. Horizontal limits are not defined by analytical data in the northern direction.
- The vertical limits of soil samples with SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent RI sample locations with the following exceptions (Figure B-8, Table B5-8):
 - Soil samples collected from the central portion of Grid H8.

- Areas with SVOCs detected at concentrations exceeding the IGWSCC have no GWQS exceedances of those SVOCs in groundwater samples, and thus do not influence the quality of groundwater.
- Soil samples with SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC located in close proximity to surface water features (Figure B-8) have the potential to locally affect the quality of surface water and sediments, although it is not the intent of this volume to fully characterize these interactions. Cross-media interactions are fully explored in Volume A of the RIR.
 - Soil samples collected from the northern and central portion of Grid F11 indicate the presence of SVOCs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream that drains to a miscellaneous pond. This pond is part of the central drainage area.
 - Soil samples collected from the western and southern portions of Grid H11 and the northern portion of Grid H12 indicate the presence of SVOCs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream that is a part of the eastern drainage area.

Metals:

- There are no established IGWSCC standards for Metals.
- The primary Metal constituents detected at concentrations exceeding the RDCSCC/NRDCSCC are Arsenic, Lead, and Thallium. Arsenic and Lead are commonly associated with historic fill.
- The horizontal limits of soil samples with Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent sample locations and are further defined by the physical boundary of the eastern and western ridges with the following exceptions (Figure B-11, Table B4-5):
 - Soil samples collected from the eastern portion of Grid G13, the southwestern portion of Grid H13, and the northern portion of Grid H14. Horizontal limits are not defined by analytical data in the southeastern direction.
- The vertical limits of soil samples with Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent RI sample locations with the following exception (Figure B-11, Table B4-6):
 - Soil samples collected from the southeastern portion of Grid H12.

- Soil samples with Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC located in close proximity to surface water features (Figure B-11) have the potential to locally affect the quality of surface water and sediments, although it is not the intent of this volume to fully characterize these interactions. Cross-media interactions are fully explored in Volume A of the RIR.
 - o Soil samples collected from the southwestern portion of Grid I11 and southeastern portion of Grid H11 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to streams in the eastern drainage area.
 - o Soil samples collected from the western portion of Grid H11 and the northwest portion of Grid H12 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream in the eastern drainage area.
 - o Soil samples collected from the northern and central portions of Grid F11 indicate the presence of Metals at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream which drains to a miscellaneous pond. This pond is in the central drainage area.

E&E:

- The primary E&E constituents detected at concentrations exceeding the IGWSCC are TNT, DNB13, and 2-A-DNT.
- The primary E&E constituents detected at concentrations exceeding the RDCSCC/NRDCSCC are TNT and NG.
- The horizontal limits of soil samples with E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent sample locations and are further defined by the physical boundaries of the eastern and western ridge (Figure B-14).
- The vertical limits of soil samples with E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent RI sample locations (Figure B-14).
- Areas with E&E constituents detected at concentrations exceeding the IGWSCC have no GWQS exceedances of those E&E constituents in groundwater samples, and thus do not influence the quality of groundwater in Area III.
- There were no soil samples with E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC located in close proximity to surface water features in Area III. Therefore E&E constituents in soil in Area III do not significantly influence the quality of surface water or sediment.

PCBs:

- There was only one sample with detected concentrations of Total PCBs exceeding the IGWSCC.
- The horizontal limits of soil samples with Total PCBs detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at adjacent sample locations and are further defined by the physical boundaries of the eastern and western ridges (Figure B-17).
- The vertical limits of soil samples with Total PCBs detected at concentrations exceeding either the RDCSCC or NRDCSCC are defined by RDCSCC/NRDCSCC compliance at the deepest interval at those sample locations (Figure B-17).
- The area with Total PCBs detected at concentrations exceeding the IGWSCC has no GWQS exceedances of Total PCBs in groundwater samples, and thus does not influence the quality of groundwater (Refer to Volume C – Groundwater RIR).
- Soil samples with Total PCBs detected at concentrations exceeding either the RDCSCC or NRDCSCC located in close proximity to surface water features (Figure B-17) have the potential to locally affect the quality of surface water and sediments, although it is not the intent of this volume to fully characterize these interactions. Cross-media interactions are fully explored in Volume A of the RIR.
 - Soil samples collected from the western portion of Grid H11 indicate the presence of Total PCBs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream in the eastern drainage area.
 - Soil samples collected from the northern portion of Grid F11 indicate the presence of Total PCBs at concentrations exceeding either the RDCSCC or NRDCSCC and are located in close proximity to a stream which feeds a miscellaneous pond. This pond is part of the central drainage system.

5.8.3 Hydraulic Oil Pipeline Investigation

Five soil samples were collected from four trenches excavated in the A-Line and Maintenance Areas (SB-R-TR-01 to SB-R-TR-05) (Figure B-1). One soil sample was collected from each trench. Benzene was detected in trench SB-R-TR-02 exceeding the RDCSCC. No BTEX, MTBE, PAHs, or PHCs were identified in any other trench at concentrations exceeding the SCC (Table B5-7). The results of the fingerprint scan for

trenches SB-R-TR-02/03/04/05 identified the potential presence of motor or lubricating oil or PHCs (Table B5-5).

5.8.4 Recently Identified AOCs Not Previously Investigated

One additional AOC (debris area) was identified during implementation of RI field activities in Area III (Figure B-47). This area appears to have been a historically low lying isolated portion of the Facility that was filled with debris (historic fill, scrap steel/iron, and general refuse). During the RI, a test pit was excavated within the center of the anticipated AOC boundary to visually classify the lithology and debris material. Test pit logs are presented in Appendix B and photos are presented in Appendix C.

The intention of the test pit was to provide a preliminary assessment of the nature of the debris present within the area. This area will be addressed along with other recently identified debris areas in Area I in the future actions work plan included in Volume A.

5.8.5 Area III Summary

The following section provides a summary of the results presented above.

- Soils with constituents detected at concentrations exceeding the IGWSCC show a very limited connection to groundwater quality; with the following exception:
 - Soil samples collected from the northern portion of Grid L11 indicate TNT and 2,4/2,6-DNT at concentrations exceeding the IGWSCC. Groundwater samples collected from this area, specifically MW-27, indicate TNT breakdown constituents (2-A-DNT, 4-A-DNT) and 2,4/2,6-DNT at concentrations exceeding the GWQS, as illustrated in Volume C – Groundwater RIR
- VOCs were detected at concentrations exceeding the RDCSCC at very few sample locations and do not represent a significant environmental condition. The source for the VOCs is believed to be historic small single release events (likely attributed to maintenance activities).
- SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are comprised primarily of PAH constituents. These constituents are primarily associated with the historically common practice of using fly ash, bottom ash, and slag as fill material. To a lesser extent, these constituents are

associated with historic manufacturing operations where these exceedances do not occur within the historic fill contour.

- The fingerprint scan performed on two samples from the Hydraulic Oil Trench Investigation indicated the potential presence of residual motor or lubricating oil, and this is not associated with the former hydraulic oil pipelines. These samples were collected adjacent to the Maintenance Area and likely represent residuals from historic maintenance activities.
- 2,4/2,6-DNT (SVOC) detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are associated with historic manufacturing operations.
- Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are primarily associated with the historically common practice of using fly ash, bottom ash, and slag as fill material (historic fill) to improve the grade of the Facility, recover unusable land, and establish numerous narrow gauge rail beds. To a lesser extent, these constituents are associated with historic manufacturing operations where these exceedances do not occur within the historic fill areal extent contour.
- E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are associated with historic manufacturing operations.
- Total PCBs detected at concentrations exceeding either the RDCSCC or NRDCSCC in the central Maintenance Area are associated with historical maintenance, power generation and power transmission activities. Other isolated exceedances are potentially due to the presence of individual transformers.
- The following table presents a summary of the number of samples with SCC exceedances and exceedance percentages:

Number of Locations	Number of Samples	Samples with IGWSCC Exceedances	Samples with RDCSCC Exceedances	Samples with NRDCSCC Exceedances	Percentage of Samples with IGWSCC Exceedances	Percentage of Samples with RDCSCC Exceedances	Percentage of Samples with NRDCSCC Exceedances
749	872	197	325	268	23%	37%	31%

6.0 CONCLUSIONS

The following section provides the conclusions for Volume B (Soils) of the RIR. These conclusions are based on the evaluation of 3,309 laboratory analyzed soil samples (1,295 RI samples and 2,014 SI samples) collected throughout the Facility. The results of SI sampling and analyses were used to select the focused laboratory analyses performed in the RI. Specifically, the RI analyte list is comprised of any constituent identified at concentrations exceeding the applicable soil cleanup criteria presented in the Soils-SI.

In addition to laboratory analyses, professional judgment based on extensive historic E&E manufacturing operations was considered. Key personnel consulted included Harry Pascoe (Facility Historian and former Employee), Karl Broton (former Facility Employee), Peter Braxton (former Facility Employee and Area Manager), Raymond Hunt (former Facility Safety and Environmental Manager), James Bevis (present Facility Manager), and Edward Meeks (Energetic Materials Specialist).

The conclusions of each media-specific volume of the RIR are also presented in Volume A, where they are combined and further developed to define the overall site-wide characterization of the Facility. In addition, recommendations for moving forward with further characterization or remediation of the Facility are presented in Volume A.

6.1. SOIL RI SPECIFIC CONCLUSIONS

The following sections provide the specific conclusions drawn from interpretation of soil data collected during the RI.

6.1.1 Quality Assurance/Quality Control

The required sample frequencies and analytical suites presented in the Revised Site-Wide RIWP were met for all soil samples collected during the RI with the exception of 20 samples that could not be collected due to refusal or lack of recovery (discussed in Section 2.4.5). However, due to the large number of samples collected, the intent of the RI were met and these samples were not necessary.

The DQOs established for laboratory analysis of samples collected in the field were met. The evaluation of the laboratory analysis against the USEPA precision, accuracy, representativeness, comparability, and completeness parameters determined that the laboratory data are of known and acceptable quality as qualified. Therefore, the laboratory data generated for the Soil RI are considered valid and usable for decision making-purposes.

6.1.2 Historic Fill

Historic fill emplaced at the Facility is likely composed to some small degree of fly ash, bottom ash, and slag generated from on-site boilers. However, due to the short duration of the major expansion from 1912 to 1914 only a small portion of the total historic fill emplaced during the expansion was from on-site boilers. The majority of the historic fill originated from off-site sources and is believed to have possessed Metal and PAH constituents prior to entering the facility.

The deposition of historic fill appears to be widespread and heterogeneously distributed at the Facility. The total estimated areal extent of historic fill at the Facility is 161 acres. Given the broad distribution of historic fill, it is likely that additional historic fill will be encountered throughout the formerly developed portions of the Facility.

Analytical samples collected during the SI and RI within areas of known historic fill exhibit a wide range of detected constituent concentrations. The detected constituents and constituent concentrations of historic fill samples are similar to the constituents and constituent concentrations in Table 4-2 of N.J.A.C 7:26E-4.6 Remedial Investigation of Landfills and Historic Fill Material (Summary of Target Contaminant Concentrations in Typical Historic Fill Material). However, the concentrations of detected historic fill constituents are not consistent within the historic fill sample data set. This suggests that multiple sources of historic fill were secured from off-site sources and emplaced at the Facility.

6.1.3 Historical Redevelopment, Reworking and Decontamination

The Facility was operational for approximately 125 years and underwent substantial redevelopment activities including capital improvements and expansion activities, re-grading of the ground surface, demolition and decontamination activities, etc. These activities significantly disturbed the ground surface resulting in atypical heterogeneity. The Facility ceased operations in 1996 and underwent further demolition activities from 1996 to the present, further disturbing the ground surface.

Analytical samples collected for the Soils-SI were collected from 1999-2001, during the demolition activities initiated after the Facility closure. Disturbance of surface and near surface soil after the completion of the SI may have had an effect on concentrations of some constituents in some areas. Introduction of oxygen caused by physical movement of the soil may have promoted volatilization and biodegradation of some constituents. Furthermore, the breakdown of some constituents may have been promoted by the exposure to ultraviolet rays in sunlight. While these effects are likely minimal, results from the Soils-SI can be considered slightly conservative.

6.1.4 Analytical Results

The results of the laboratory analysis of the soil samples identified a total of 9,012,622 sq. ft. site-wide with constituents detected at concentrations exceeding the IGWSCC, the RDCSCC or the NRDCSCC, presented below by analytical group:

Analytical Group	Square Footage of IGWSCC Exceedances	Square Footage of RDCSCC Exceedances	Square Footage of NRDCSCC Exceedances
VOCs	99,523	51,497	0
SVOCs	2,951,659	2,188,283	1,366,838
Metals	NA	5,596,892	5,061,505
E&E	1,486,191	776,056	354,042
Total PCBs	12,295	671,121	116,347
Composite (Net)*	3,775,558	7,621,458	6,122,695

Note: Metals do not have IGWSCC

* = The composite (net) number represents the square footage of IGWSCC, RDCSCC, and NRDCSCC area exceedances incorporating all analytical groups site-wide. It is possible for an area exceedance to have identified more than one analytical group with constituents present at concentrations exceeding the IGWSCC, RDCSCC, or

NRDCSCC. Therefore, the composite (net) number may not represent the sum of the square footage for each analytical group.

Within the areas identified in the table above, the results of the soil sample laboratory analysis identified five VOCs, 19 SVOCs, 12 Metals, 8 E&E, and Total PCBs at concentrations exceeding the IGWSCC, RDCSCC or the NRDCSCC.

- Limited influence to groundwater from constituents in soil were noted across the site with three exceptions.
 - Soil samples collected from the southern portion of Grid L10 and northern portion of Grid L11 indicate TNT and 2,4/2,6-DNT at concentrations exceeding the IGWSCC. Groundwater samples collected from this area, specifically MW-27, indicate TNT breakdown constituents (2-A-DNT, 4-A-DNT) and 2,4/2,6-DNT at concentrations exceeding the GWQS, as illustrated in Volume C – Groundwater RIR
 - Soils with constituents detected at concentrations exceeding the IGWSCC show a connection to groundwater quality in the TNT Area, the PETN Area, and the western Dynamite and NG Areas. Groundwater samples taken in these areas indicate TNT, TNT breakdown constituents (2-A-DNT, 4-A-DNT), 2,4/2,6-DNT and NG exceeding the GWQS, as illustrated in Volume C – Groundwater RIR.
- VOCs were detected at concentrations exceeding either the RDCSCC/NRDCSCC at very few sample locations and do not represent a significant environmental condition. The source for the VOCs is believed to be small historic single release events (likely attributed to maintenance activities).
- SVOCs detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are comprised primarily of PAH constituents. These constituents are primarily associated with the historically common practice of using fly ash, bottom ash, and slag as fill material (historic fill) to improve the grade of the Facility, recover unusable land, and establish numerous narrow gauge rail beds. To a lesser extent, these constituents are associated with historic manufacturing operations where these exceedances do not occur within the historic fill contour.
- 2,4/2,6-DNT (SVOC) detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are associated with historic manufacturing operations.
- Metals detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are primarily associated with the historically common practice of using fly ash, bottom ash, and slag as fill material (historic fill) to improve the grade of the Facility, recover unusable land, and establish numerous narrow gauge rail beds. To a lesser extent, these constituents are associated with historic

manufacturing operations where these exceedances do not occur within the historic fill areal extent contour.

- E&E constituents detected at concentrations exceeding either the RDCSCC or NRDCSCC at the Facility are associated with historic manufacturing operations
- Total PCBs detected at concentrations exceeding either the RDCSCC or NRDCSCC in the central Maintenance Area are associated with historical maintenance, power generation and power transmission activities. Other isolated exceedances are potentially due to the presence of individual transformers at various locations throughout the Facility.

6.2. GENERAL CONCLUSION

The Kenvil Facility was operational for approximately 125 years and represented a major E&E manufacturer for every war and conflict fought by the United States and its allies throughout the 20th century. In addition to military production, the facility also substantially supported mining, construction, and oil exploration activities..

Following this long and active history, constituents detected above the SCC are contained within the Facility and occur primarily within the former operational areas. The horizontal extent of constituents detected at concentrations exceeding the SCC is well defined. The vertical extent of constituents detected at concentrations exceeding the SCC is largely defined. Limited additional characterization may be warranted prior to selecting the appropriate remedial action in the forthcoming remedial action selection report (RASR).

Notes:
VOCS = Volatile organic constituents
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
PCBS = Polychlorinated biphenyls
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NA = Not applicable
NS = No standard
* Site Specific Screening Level = Criteria were provided to Hercules by NJDEP in the June 19, 2003 Correspondence
NJSCC 1999 = NJDEP Soil Cleanup Criteria last revised on May 12, 1999

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
VOCS = Volatile organic constituents
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NA = Not analyzed
NS = No standard
TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the IGWSCC
Bold = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the RDCSCC
Shade = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the NRDCSCC

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
VOCS = Volatile organic constituents
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NA = Not analyzed
NS = No standard
SB = Soil boring
TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the IGWSCC
Bold = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the RDCSCC
Shade = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the NRDCSCC.

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
VOCS = Volatile organic constituents
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NS = No standard
SB = Soil boring
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the IGWSCC
Bold = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the RDCSCC
Shade = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the NRDCSCC

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
VOCS = Volatile organic constituents
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NS = No standard
SB = Soil boring
TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the IGWSCC
Bold = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the RDCSCC
Shade = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the NRDCSCC

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NS = No standard
TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the IGWSCC
Bold = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the RDCSCC
Shade = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the NRDCSCC

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
VOCS = Volatile organic constituents
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NA = Not analyzed
NS = No standard
SD = Sediment
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the IGWSCC
Bold = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the RDCSCC
Shade = Indicates that the practical quantitation limit provided by laboratory analysis exceeded the NRDCSCC

TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the method detection limit provided by laboratory analysis exceeded the IGWSCC
Bold = Indicates that the method detection limit provided by laboratory analysis exceeded the RDCSCC
Shade = Indicates that the method detection limit provided by laboratory analysis exceeded the NRDCSCC

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
VOCS = Volatile organic constituents
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NA = Not analyzed
NS = No standard
SB = Soil boring
TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the method detection limit provided by laboratory analysis exceeded the IGWSCC
Bold = Indicates that the method detection limit provided by laboratory analysis exceeded the RDCSCC

SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NS = No standard
SB = Soil boring
TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the method detection limit provided by laboratory analysis exceeded the IGWSCC
Bold = Indicates that the method detection limit provided by laboratory analysis exceeded the RDCSCC
Shade = Indicates that the method detection limit provided by laboratory analysis exceeded the NRDCSCC

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
VOCS = Volatile organic constituents
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NA = Not analyzed
NS = No standard
SB = Soil boring
TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the method detection limit provided by laboratory analysis exceeded the IGWSCC
Bold = Indicates that the method detection limit provided by laboratory analysis exceeded the RDCSCC
Shade = Indicates that the method detection limit provided by laboratory analysis exceeded the NRDCSCC

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NA = Not analyzed
NS = No standard
TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the method detection limit provided by laboratory analysis exceeded the IGWSCC
Bold = Indicates that the method detection limit provided by laboratory analysis exceeded the RDCSCC
Shade = Indicates that the method detection limit provided by laboratory analysis exceeded the NRDCSCC

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NS = No standard
TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the method detection limit provided by laboratory analysis exceeded the IGWSCC
Bold = Indicates that the method detection limit provided by laboratory analysis exceeded the RDCSCC
Shade = Indicates that the method detection limit provided by laboratory analysis exceeded the NRDCSCC

Table B2-1

Soil - AOCs Reserved for the RI - Area I
Volume B - Remedial Investigation Report
Hercules Incorporated
Kenvil Works Facility, New Jersey

Remedial Area	Operational Area	AOC Designation	Name	Description	Justification for Reserving the AOCs for the RI	Proposed Analytical Requirements*	Analytical Group Added due to Field Observations**
Area I	B-Line	M8-1	Disposal Area	Large area of stressed vegetation. Filled with building debris, scrap metal, wood, and drums. Some drums are buried and/or corroded (perimeter=21,00 feet).	This AOC was reserved for the Remedial Investigation, based on Phase I - Site Investigation Field Observation	VOCs, SVOCs, Metals, E&E, PCBs	-
Area I	Development	K5-1	Former Drum Disposal Area	An area adjacent to narrow gauge rail. Several hundred drums with metal debris, broken glass, and an old piece of process equipment on the surface. Drums and metal debris removed as part of IRM (perimeter=500 foot). Minimal evidence of release from sieve.	This AOC was reserved for the Remedial Investigation, based on Phase I - Site Investigation Field Observation	VOCs, SVOCs, Metals, E&E, PCBs	-
Area I	Development	K5-2	Pond	Shallow pond that contained approximately 50 drums and metal debris on the surface. Pond may be seasonal and trees are growing within the pond. Drums and metal debris removed as part of IRM (perimeter=500 feet).	This AOC was reserved for the Remedial Investigation, based on Phase I - Site Investigation Field Observation	VOCs, SVOCs, Metals, E&E, PCBs	-
Area I	Development	M5-3	Old Burning Ground	Area used to thermally decontaminate old equipment. Debris consists of shell casings, lead pipes, wood, old process equipment and other metal fragments. Several areas of stressed vegetation within the boundary (area=127,000 sq. ft.).	SI Sampling locations SB-M5-3-02/04/07/11/17/19 were determined using XRF screening; Results indicated a lead concentration of 1,232 ppm, a copper concentration of 1,410 ppm and a zinc concentration of 1,240 ppm at SB-M5-3-02; a zinc concentration of 3,670 ppm at SB-M5-3-04; a lead concentration of 1,493 ppm, a copper concentration of 1,000 ppm and a zinc concentration of 13,290 ppm at SB-M5-3-07; a lead concentration of 3,820 ppm, a copper concentration of 2,090 ppm and a zinc concentration of 6,100 ppm at SB-M5-3-11; a lead concentration of 2,358 ppm, a copper concentration of 1,073 ppm and a zinc concentration of 2,470 ppm at SB-M5-3-17; a lead concentration of 1,884 ppm, a copper concentration of 694 ppm and a zinc concentration of 7,610 ppm at SB-M5-3-19; Group B E&E materials were detected at sampling locations SB-M5-3-01/02/04/16/17/19	VOCs, SVOCs, Metals, E&E, PCBs	-
Area I	Finishing	J7-1	Graphite Pond	Former pond that received waste from Blender/Packer House J7-2281 J7-2282; pine trees in former pond; no water in former pond. No evidence of negative impact to the pond (area=18,000 sq. ft.).	This AOC was reserved for the Remedial Investigation due to the presence of E&E materials, based on Phase I - Site Investigation Field Observation	SVOCs, E&E	Metals
Area I	Storage	J10-2166	D-2 Wax House	CMU foundation with wooden siding. Catch tank on S side.	This AOC was reserved for the Remedial Investigation due to the presence of E&E materials, based on Phase I - Site Investigation Field Observator	SVOCs, E&E	-
Area I	Storage	N6-1	Disposal Area	Area used for disposal of solid materials: machinery, concrete, drums, wood, etc. Disposal area currently covered with grass (perimeter=2000 feet).	This AOC was reserved for the Remedial Investigation, based on Phase I - Site Investigation Field Observation	VOCs, SVOCs, Metals, E&E, PCBs	-

Notes:

AC = Air conditioning

AOC = Area of concern

AST = Aboveground storage tank

Bldg = Building

DIGL-RIP = Stick propellant

E&E = Explosive and energetic

EQ = Equilization tank

FID = Flame-ionization detector

Gal = Gallon

HVAC = Heating ventilation/air conditioning

IRM = Interim remedial measure

NA = Not applicable

NC = Nitrocellulose

NG = Nitroglycerin

No. = Number

PETN = Pentaerythritol tetranitrate

PID = Photoionization detector

PPM = Parts per million

PVC = Polyvinyl chloride

RR = Railroad

Sq Ft = Square Foot

SS = Stainless steel

SV = Stressed vegetation

TNT = 2,4,6-Trinitrotoluene

WWTP = Wastewater treatment plant

XRF = X-ray fluorescence

~ = Approximately

` = Foot

" = Inch

? = Unknown

Group A explosives include TNT, TNB, Picric Acid and Comp B

Group B explosives include RDX, PETN, dynamite, SEMTEXT, nitrocellulose and nitroglycerin

Group C explosives include those containing nitrates such as ANFO and black powder

*In the event field observations indicated the presence of an analytical group within a sample interval which was not specified in the SI, the analytical group was added to the analytical requirements for that sample.

**Refer to Appendix B - Soil Boring Logs for field observations made during the RI.

VOCS = Volatile organic constituents
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
PCBS = Polychlorinated biphenyls
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NA = Not analyzed
SB = Soil boring
TP = Test pit
* = Preliminary Location ID was established in the Remedial Investigation Work Plan
X = Sample was submitted for laboratory analysis for analytical group indicated on table
Y = Sample was identified by laboratory analysis at concentrations exceeding the IGWSCC/RDCSCC/NRDCSCC for analytical group indicated on table
SI = Site Investigation
RI = Remedial Investigation
AOC = Area of Concern
SI AOC Rsvd for RI = These samples were collected from SI AOCs Reserved for the RI
SI AOC Vertical = These samples were collected for vertical delineation from SI AOC-based locations where SI samples collected at depths greater than 2-ft. bgs indicated applicable soil residential cleanup criteria exceedances.
Area I AOC-Based = These samples were collected following the Area I RIWP.

J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
B = Indicates that the constituent was found in the associated blank
Outline = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the IGWSCC
Bold = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the RDCSCC
Shade = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the NRDCSCC

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
VOCS = Volatile organic constituents
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
PCBS = Polychlorinated biphenyls
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NA = Not analyzed
NS = No standard
SB = Soil boring
TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the IGWSCC
Bold = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the RDCSCC
Shade = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the NRDCSCC

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
VOCS = Volatile organic constituents
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
PCBS = Polychlorinated biphenyls
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NA = Not analyzed
NS = No standard
SB = Soil boring
TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Outline = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the IGWSCC
Bold = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the RDCSCC
Shade = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the NRDCSCC

Notes:
All sample depths on this table (0.5-1.0) refer to feet below ground surface
VOCS = Volatile organic constituents
SVOCS = Semi-volatile organic constituents
E&E = Explosive and energetic constituents
PCBS = Polychlorinated biphenyls
IGWSCC = Impact to groundwater soil cleanup criteria
RDCSCC = Residential direct contact soil cleanup criteria
NRDCSCC = Non-residential direct contact soil cleanup criteria
NA = Not analyzed
NS = No standard
SB = Soil boring
TP = Test pit
U = Indicates that the constituent was analyzed for but not detected, number indicates the detection limit
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
B = Indicates that the constituent was found in the associated blank
Outline = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the IGWSCC
Bold = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the RDCSCC
Shade = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the NRDCSCC
