OBG

FINAL

Phase II Sediment Remedial Investigation Report
Hercules Incorporated – Former Kenvil Works
Kenvil, New Jersey

Hercules Incorporated
Wilmington, Delaware

May 3, 2016

TABLE OF CONTENTS

1 Introduction 1
1.1 Scope and Objectives 1
1.2 Report Organization 2
2 Scope of Work 3
2.1 Summary of Previous Investigations 3
2.2 Phase II Sediment RI Scope of Work 4
2.2.1 Sediment Sampling Methods 6
2.2.1.1 Simple Scoop 6
2.2.1.2 Bucket Auger 6
2.2.1.3 Loose Sediment Sampling Kit 7
2.2.2 Surveying 7
2.2.3 Utility Mark Out 7
2.2.4 Sample Identification 7
2.2.5 Laboratory Analysis 8
3 Summary of Data Quality 9
3.1 Holding Times 9
3.2 Review of Case Narrative Information 9
3.2.1 Effects on Data Quality 10
3.3 Field and Trip Blank Results 10
3.4 Duplicate Sample Results 10
3.5 Tentatively Identified Compounds 11
4 Drainage Area Descriptions 12
4.1 Drainage areas 12
4.2 Surface Water Feature Types 14
4.3 Summary 15
5 Results 16
5.1 Sediment Quality Benchmarks 16
5.2 Constituent Influences Unrelated to Historical Facility Operations 18
5.3 Phase II Results 20
5.3.1 Evaluation of Sediment Quality Outside Stream Channels in Wetland Areas 20
5.3.1.1 SVOCs 20
5.3.1.2 Metals 21
5.3.1.3 E&E Constituents 23
5.3.1.4 General Conclusions 23
5.3.2 Relationship between Surface Water and Sediment 23
5.3.2.1 SVOCs 23

5.3.2.2 Metals 24
5.3.2.3 E&E Constituents 25
5.3.2.4 General Conclusions 25
5.3.3 Evaluation of Vertical Delineation Results 26
5.3.3.1 VOCs 26
5.3.3.2 SVOCs 26
5.3.3.3 Metals 27
5.3.3.4 E&E Constituents 28
5.3.3.5 General Conclusions 29
5.3.4 Facility Wide Evaluation of Sediment Sample Results 29
5.3.4.1 VOCs 30
5.3.4.2 5.3.4.2 SVOCs 30
5.3.4.3 Metals 34
6 Conclusions 41
6.1 Phase II Sediment RI Findings 41
6.2 Specific Phase II Sediment RI Findings 41
6.2.1 Evaluation of Sediment Quality Outside Stream Channels 41
6.2.2 Relationship between Surface Water and Sediment 41
6.2.3 Evaluation of Vertical Delineation Results 42
6.3 Overall RI Findings – Sediment 42
6.3.1 Site Characterization 42
6.3.2 Historic Fill 43
6.3.3 Extent of COCs 43
6.4 Recommendations 44

Appendix A – NJDEP Comment Letter
Appendix B – Phase II RI Memorandum
Appendix C - Photographs of Select Sediment Sample Locations
Appendix D – Laboratory Data Packages
Appendix E – Site-Specific LEL/SEL Calculations
Appendix F – Data to Document Off-Site Influences
Appendix G - Updated MWH Si and Phase I RI Tables

1 INTRODUCTION

Hercules Incorporated (Hercules) retained O'Brien & Gere Engineers, Inc. (OBG) to prepare this Phase II Remedial Investigation Report (RIR) summarizing the results of Remedial Investigation (RI) activities conducted at the former Kenvil Works Facility (Facility), located in Kenvil, New Jersey. RI activities were conducted as part of the ongoing environmental investigation at the Facility in fulfillment of a March 10, 1995 Remedial Agreement (RA) between New Jersey Department of Environmental Protection (NJDEP) and Hercules and in accordance with New Jersey's Industrial Site Recovery Act (ISRA) and New Jersey Administrative Code (N.J.A.C.) 7:26E –*Technical Requirements for Site Remediation* (TRSR).

The RIR is presented in six volumes due to the magnitude of the investigation and is organized as follows:

- Volume A – RI Summary Document. This volume of the report presents RI objectives, a summary of previous investigations, brief summary of scope of work, data quality control objectives, a description of Facility drainage systems, a brief summary of results, and conclusions and recommendations.
- Volume B – Phase II Soil remedial investigation.
- Volume C – Phase II Groundwater remedial investigation.
- Volume D – Phase II Sediment remedial investigation.
- Volume E – Phase II Surface Water remedial investigation.
- Volume F – Ecological Risk Assessment.

This organization provides a series of stand-alone, focused documents to facilitate review of the RIR. Where appropriate, volumes cross reference each other and the reviewer may occasionally find it necessary to refer to other volumes of this RIR. Each volume builds upon previous investigation findings (i.e., site investigation [SI] and Phase I RI) and leverages professional judgment based on extensive historic Explosive and Energetic (E&E) manufacturing operations experience. The findings and conclusions of each media-specific volume and the ecological risk assessment are tied together in a comprehensive conceptual site model and overall RI conclusions and recommendations presented in the summary volume. The approach and organization of the RIR was developed in conjunction with the licensed site remediation professional (LSRP) for the Facility (Mark Foley, WSP USA Corp., LSRP ID No. 575999) and fulfills RI reporting requirements established at N.J.A.C. 7:26E-4.9.

This volume, Volume D – Phase II Sediment-RI Report, presents the results of sediment investigations (SI, Phase I RI and Phase II RI) conducted at the Facility to characterize and delineate Facility-related influences on sediment. The Phase II RI results are evaluated in the context of specific Phase II RI objectives, and as part of the comprehensive sediment dataset relative to overall RI objectives.

1.1 SCOPE AND OBJECTIVES

The Phase II Sediment-RI collected additional information to supplement the findings of the surface-water and sediment site investigation (SW/SD-SI) and Phase I Sediment-RI, in order to complete the characterization of the Facility as required in the TRSR and address comments provided by the NJDEP (Appendix A). During the Phase II Sediment-RI, data were collected to complete the following objectives:

- Evaluate sediment quality outside of defined channels within wetland areas
- Confirm the depth of constituents at concentrations above applicable standards/benchmarks at select locations
- Further characterize the extent of Facility-related influences in the interior of the Facility (former operational areas)
- Evaluate surface water/sediment interactions

1.2 REPORT ORGANIZATION

This volume (Volume D – Phase II Sediment-RI) addresses Facility-related influences on sediment, presenting the results of Phase II RI soil sampling and refining the conclusions of the Phase I Sediment-RIR (MWH Americas Inc. [MWH], 2007) and the Surface Water and Sediment Site Investigation Report (SW/SD-SIR) (MWH, 2004).

Hercules conducted the Sediment-SI between 1999 and 2003, submitted the SW/SED-SIR in 2004, and received NJDEP approval of the Sediment-SIR in 2005. Following the SI, Hercules developed the Area I Remedial Investigation Work Plan (Area I RIWP, MWH, 2005) and Revised Site-Wide Remedial Investigation Work Plan (Revised Site-Wide RIWP) (MWH, 2006) framing Phase I RI activities. Hercules presented the results of the Phase I RI activities to NJDEP in the Phase I Sediment RI Report7, and received comments from NJDEP on the Phase I Sediment-RI in 2010. In 2011, Hercules retained the LSRP for the Facility and developed a framework in which to address NJDEP's 2010 comments and complete the RI within regulatory timeframe established by the Site Remediation Reform Act (N.J.S.A. 58:10C-1 et seq.). Phase II RI sampling activities outlined in the Phase II Remedial Investigation Memorandum (OBG, 2013) were developed in consultation with the LSRP in November 2013.

The Phase II RI sampling focused on filling data gaps identified in NJDEP's 2010 comments on the Phase I RI and completing characterization of conditions onsite as required by the TRSR.

The remainder of this volume is organized as follows:

- Section 2 presents a detailed description of the Phase II Sediment-RI field scope of work (SOW) and laboratory activities.
- Section 3 presents the data quality control discussion.
- Section 4 describes the types of surface water features present at the Facility.
- Section 5 discusses the criteria used to evaluate the sediment analytical results and presents the findings of the Sediment-RI.
- Section 6 presents conclusions for the Sediment remedial investigation.

2 SCOPE OF WORK

The Phase II RI Scope of Work builds upon the findings of previous environmental investigations at the Facility, addresses data gaps necessary to fulfill RI requirements per the TRSR, and addresses specific NJDEP comments concerning sediment quality outside of defined channels, vertical delineation, and surface water/sediment interactions. In addition, the Phase II RI Scope of Work considers comments issued by NJDEP in November 2010 on the Phase I Sediment RI Report (MWH, 2007). Results from previous investigations, summarized below, were used as the basis for the Phase II RI field sampling objectives and activities. Specifically, these objectives include:

- Evaluating sediment quality outside of defined channels within wetland areas
- Confirming the depth of constituents at concentrations above applicable standards at select locations
- Further characterizing the extent of Facility-related influences in the interior of the Facility (former operational areas)
- Evaluating surface water/sediment interactions

This section summarizes previous sediment investigations conducted at the Facility, and presents the scope of work for the Phase II Sediment RI, including focused objectives, sediment sample identification process, and sampling and analytical methods.

2.1 SUMMARY OF PREVIOUS INVESTIGATIONS

During the SI and Phase I Sediment-RI, 157 SI sediment samples and 403 RI sediment samples were collected from intermittent streams, perennial streams, wetlands, and ponds within the five drainage areas delineated at the Facility (see Section 4) and submitted for laboratory analysis. The data were compared to the sediment screening benchmarks recommended by NJDEP at the time of the investigation, these benchmarks included the lowest effects level (LEL) and severe effects level (SEL) values published in *Guidelines for the Protection and Management of Aquatic Sediment Quality in Ontario* (Persaud et al. 1993), consistent with NJDEP's Guidelines for Sediment Quality Evaluations (1998).

Previous investigation findings are summarized below:

- Facility-related constituents with an established LEL or SEL are delineated within the boundaries of the Facility.

- A volatile organic compound (VOC) (tetrachloroethene [PCE]) was detected at concentrations exceeding its LEL in the Western Drainage Area sediment. PCE in sediment is believed to be attributable to the discharge of a regional chlorinated VOC groundwater plume unrelated to former Facility operations.

- Semi-volatile organic compounds (SVOC) detected in sediment at the Facility at concentrations exceeding their respective LELs/SELs are comprised primarily of polycyclic aromatic hydrocarbons (PAH) constituents.

- Non-PAH SVOCs (2,4-dinitrotoluene (2,4-DNT), 2,6-dinitrotoluene (2,6-DNT), Bis(2-Ethylhexyl)Phthalate, 4,6-Dinitro-2-Methylphenol, Di-N-Butyl Phthalate, Diethyl Phthalate, and N-Nitrosodiphenylamine) detected in sediment at the Facility at concentrations exceeding their respective LELs/SELs are associated with historic manufacturing processes.

- Metals detected in sediment at the Facility at concentrations exceeding their respective LELs/SELs are associated with the historically common practice of using fly ash as fill material (historic fill) to improve the grade of the Facility, recover unusable land, and establish numerous narrow gauge rail beds. Prior to the 1920's, it is known that spent acids resulting from the nitration process of E&E manufacture (sour water) was discharged to the Facility's surface water bodies as no commercially viable means of recovering spent acids was available. The low pH sour water is believed to possibly contain Metal constituents derived from contact with process vessels and piping. Detected concentrations of Metal constituents exceeding either the LEL or SEL without associated PAH constituents attributed to historic fill are believed to be derived from the historic practice of discharging sour water to the surface water bodies.

- E&E constituents detected at concentrations exceeding their respective LELs at the Facility are associated with historical manufacturing operations.

- Metal and SVOC constituents identified in the SI sediment sample SD-E16-3-01 at concentrations exceeding the LEL or SEL adjacent to the only surface water discharge point SW-E16-3-01 are attributed to impacts from Route 46. Sediment samples collected during the RI at the same location and up-gradient did not indicate any Metal or SVOC exceedances. Similar effects were observed at all surface water inflow points adjacent to roads Route 46 and Howard Boulevard and the New Jersey Transit Rail.

NJDEP commented on the Phase I RI conclusions listed above in its November 2010 comment letter, requiring additional delineation of the lateral extent of Facility-related influences in sediment beyond the defined stream channels, and vertical delineation at a subset of SI/RI sample locations. Based on the findings of the Phase I Sediment RI Report and associated NJDEP comments, Hercules prepared a Phase II RI Work Plan Memorandum (OBG 2013) outlining the scope of work summarized below.

2.2 PHASE II SEDIMENT RI SCOPE OF WORK

The Phase II Sediment RI sediment sampling activities generated data to supplement the results of the Sediment/Surface Water SI and Phase I Sediment RI and complete characterization of sediment at the Facility as required in the TRSR.

Specific Phase II Sediment RI objectives include:

- Evaluating sediment quality outside of defined channels within wetland areas
- Confirming the depth of constituents at concentrations above applicable standards at select locations
- Further characterizing the extent of Facility-related influences in the interior of the Facility (former operational areas)
- Evaluating surface water/sediment interactions

In accordance with the Phase II Remedial Investigation Memorandum (OBG, 2013) (Appendix B), 26 sediment samples were collected from Facility to achieve these objectives. Where possible, a single sample/sample location was used to fulfill data needs for multiple objectives (i.e., Phase II Sediment RI sample SD-R2-C-15-1 evaluated sediment quality outside the defined stream channel as well as surface water/sediment interaction).

Twenty (20) sediment samples were collected from the following locations and analyzed for Target Compound List (TCL) SVOCs, Target Analyte List (TAL) Metals, and E&E constituents to evaluate sediment quality outside of defined stream channels within wetland areas:

- SD-R2-G-12-1
- SD-R2-G-12-3
- SD-R2-G-12-4
- SD-R2-G-12-5
- SD-R2-F-14-1
- SD-R2-F-14-2
- SD-R2-E-13-1
- SD-R2-D-14-1
- SD-R2-C-12-6
- SD-R2-C-11-1
- SD-R2-C-15-1
- SD-R2-C-15-2
- SD-R2-K-5-1
- SD-R2-K-5-2
- SD-R2-O-4-1
- SD-R2-O-4-2
- SD-R2-E-16-3
- SD-R2-E-10-1
- SD-R2-E-10-2
- SD-R2-O-4-3

Five (5) sediment samples were collected from the following locations and analyzed for TCL VOCs (locations SD-R2-E-16-1 and SD-R2-E-16-1D only), TCL SVOCs, TAL Metals, and E&E constituents to delineate the vertical extent of Facility-related influences on sediment relative to applicable comparison criteria.

- SD-R2-E-16-1 (depth 0 to 0.5 ft.) – outfall near Route 46
- SD-R2-E-16-1D (depth 2 to 2.5 ft.) – outfall near Route 46
- SD-R2-M-7-01D (depth 2.5 to 3 ft.) – corresponding to sample location SD-R-M-7-01 of Phase I RI
- SD-R2-L-5-01D (depth 2.5 to 3 ft.) – corresponding to sample location SD-R-L-5-01 of Phase I RI
- SD-R2-L-5-02D (depth 2.5 to 3 ft.) – corresponding to sample location SD-R-L-5-02 of Phase I RI

Seven (7) co-located surface-water and sediment samples were collected from the following locations and analyzed for TCL SVOCs, TAL Metals, and E&E constituents to evaluate the influence of constituents in sediment on overlying surface water.

- SW-R2-B-15-1 and SD-R2-C-15-1
- SW-R2-B-15-2 and SD-R2-C-15-2
- SW-R2-E-16-1 and SD-R2-E-16-1
- SW-R2-E-16-3 and SD-R2-E-16-3
- SW-R2-F-14-1 and SD-R2-F-14-1
- SW-R2-F-14-2 and SD-R2-F-14-2
- SW-R2-G-12-2 and SD-R2-G-12-3

A total of 15 co-located surface water/sediment sample locations were proposed as part of the Phase II RI Memorandum (OBG, 2013). However, a lack of surface water present during sampling reduced the number of sample locations.

Figure D-1 presents sediment sample locations. Tables D-1 and D-2 present analytical parameters and methods, and sample results, respectively.

Deviations from the Phase II RI Memorandum included:

- A reduction in the number of co-located surface-water and sediment sample pairs from 15 (as proposed in the Phase II RI Memorandum) to 7 based on field conditions. Eight (8) proposed surface-water samples were unable to be collected due to an absence of surface water at these locations. Each of the 15 proposed sediment samples were collected.

- The elimination of one sediment sample based on field conditions. Sediment was not present at proposed sample SD-R2-G-12-2 presented in the Phase II RI Memorandum (OBG, 2013). Substrate conditions observed in the field were not depositional in nature and did not possess the hydrology necessary to support a benthic invertebrate community, and thus are not sediment by definition. Rather, the substrate was considered soil and no sample was collected. The photograph log (Appendix C) presents additional details related to substrate conditions at this location.

Additional noteworthy observations were made by field personnel relative to the conditions at sample location SD-R2-O-4-3. Overland flow represents the primary source of hydrology to the isolated miscellaneous pond targeted by the proposed sample location SD-R2-O-4-3. Standing water was not observed at the time of sampling, however, the substrate was moist, potentially hydric, and contained organic matter and the material was sampled as if it were sediment. The photograph log (Appendix C) presents additional details related to substrate conditions at this location.

2.2.1 Sediment Sampling Methods

Sediment samples were collected using one of three sampling methods, a simple scoop (for compact sediments), a bucket auger (for cohesive sediments), or a loose sediment sampling kit (for liquefied sediments). The sediment sampling activities were conducted in accordance with the Final Field Quality Assurance Project Plan (FQAPP) (MWH, 2006) and the Phase II RI Memorandum (OBG, 2013) and are described below.

To ensure the safety of field and laboratory personnel field screening for the presence of E&E constituents was conducted prior to the collection of the sediment samples. The screening process included:

- Visually inspecting the sampling location for the presence of E&E constituents
- For sediments free of visible quantities E&E constituents, field testing for residual E&E constituents was conducted using the EX-PRAY® system in accordance with Section 5.1 of the FQAPP. E&E constituents were not identified at concentrations requiring modification to the Phase II Remedial Investigation Memorandum at any of the sediment sample locations.

2.2.1.1 Simple Scoop

Some shallow samples analyzed for TCL SVOCs, E&E compounds, and TAL Metals were collected using stainless steel scoops. Only the most cohesive/compact sediments from the 0-0.5 ft sample interval were collected using this technique, which is summarized below:

- A new decontaminated stainless steel scoop was used to removed sample material from the location-specific interval;
- Sample material was placed into a decontaminated stainless steel bowl and homogenized; and
- Sample material was transferred from the stainless steel bowl to laboratory-supplied sample containers.

2.2.1.2 Bucket Auger

Most shallow sediment samples were collected with a decontaminated stainless steel bucket auger, provided the sediment was sufficiently cohesive to be held within the bucket auger without losing the fine grained components of the sediment. The bucket auger was advanced by hand at each sampling location for classification and sample collection. It was then advanced at 6-inch intervals and removed from the borehole for evaluation. Sediment sample collection procedures using a bucket auger are summarized below:

- The bucket auger was advanced to the desired depth and removed for sediment classification and sample collection;
- The sample material collected from the auger was placed into a decontaminated stainless steel bowl and homogenized; and
- Sample material was transferred from the stainless steel bowl to laboratory-supplied sample containers.

2.2.1.3 Loose Sediment Sampling Kit

Sediment that was too unconsolidated for collection using a bucket auger was sampled using the loose sediment sampling kit. The loose sediment sampling kit consists of a hollow, cylindrical auger outfitted to accommodate a disposable plastic liner; a tapered tip; and an attachable slide hammer that is used to advance the auger when deeper samples are required. Samples requiring use of this kit were collected as summarized below:

- A new plastic liner was inserted into the mouth of the auger and secured by screwing on the auger's tip, and the slide hammer was attached if necessary;
- The auger was advanced into the sediment to the desired depth and removed for sediment classification and sample collection;
- The auger tip was removed, exposing the plastic liner and sample material contained therein; and
- Plastic liner was removed from the auger and sample material was transferred from within the liner to the laboratory-supplied sample containers.

All non-disposable equipment was decontaminated and disposable sampling equipment and personal protective equipment replaced between samples.

2.2.2 Surveying

Sediment sampling locations were established by a New Jersey-licensed surveyor using a hand-held global positioning system (GPS) unit with sub-meter accuracy. Horizontal control was referenced to the New Jersey State Plane Coordinate system (North American Datum of 1983 [NAD83]). Vertical control was referenced to the National Geodetic Vertical Datum of 1929 (NGVD 29).

2.2.3 Utility Mark Out

Prior to mobilizing to the Facility to conduct the Phase II Sediment RI, sediment locations were marked in the field by an OBG geologist. After the locations were marked, New Jersey One Call was notified of the planned sampling activities and a utility mark out was requested. The sediment sampling locations were subsequently cleared.

2.2.4 Sample Identification

Unique sample identifications (IDs) were provided for each sample. The sample IDs included the matrix type (SD for sediment), an indication they were collected during the Phase II RI (R2), a grid square location and boring number within the grid square. If two samples were collected from the same location, a "D" was placed at the end of the deep sample ID.

A typical sample ID from the Phase II RI is SD-R2-G-12-1. This ID indicates the following:

- The sample is a sediment sample (SD)
- The sample was collected during the second phase of the remedial investigation (R2)
- the sample was the first boring collected from grid square G12 (G-12-1)
- the sample is a surface sample, as the "D" designation is absent

2.2.5 Laboratory Analysis

The sediment and associated quality control samples collected were submitted to Eurofins Lancaster Laboratories, a New Jersey certified laboratory, for analysis. The samples were analyzed for the following parameters:

- TCL VOCs using USEPA Methods 8000C/8260B
- TCL SVOCs using USEPA Methods 8000C/8270D
- E&E using USEPA Method 8330
- Perchlorate using USEPA Method 6850
- Nitrocellulose using Lancaster Laboratory SOP
- TAL Metals using USEPA Methods 6010C/6020A
- Mercury using USEPA Methods 7470A/7471A
- Total organic carbon (TOC) Method 5310 C-2000.

Prior to shipping sediment samples to the laboratory, the soil samples were screened for E&E constituents. The E&E screening indicated there were no E&E concentrations that would restrict shipment to the laboratory.

Quality Assurance/Quality Control (QA/QC) samples that were collected as part of the sediment sampling program included the following:

- One trip blank sample per sample shipment that required analysis for TCL VOCs
- One duplicate sample per each 20 field samples
- One field blank per each 10 field samples but no more than one per day
- One matrix spike (MS)/matrix spike duplicate (MSD) sample per sample delivery group

3 SUMMARY OF DATA QUALITY

This section provides an evaluation of laboratory data for Phase II RI sediment samples in the context of NJDEP's 2014 Data Quality Assessment and Data Usability Evaluation Technical Guidance (NJDEP, 2014). The SI and Phase I RI sediment data were previously reviewed in the Soils SIR and Phase I RIR, respectively, and found to be of sufficient quality for use in evaluating site conditions and subsequent actions...

The data quality review performed on samples collected during the Phase II Sediment RI included an evaluation of holding times, case narrative information, field and trip blank results, and duplicate analyses. The evaluation was conducted for VOCs, SVOCs, E&E constituents, and TAL Metals. Laboratory data packages are provided in Appendix D. The sediment samples were included in the following sample delivery groups (SDG):

- KVM03
- KVM04
- KVM05
- KVM06

3.1 HOLDING TIMES

For each sample collected during the Phase II Sediment RI, the data packages were reviewed to verify that sample analysis occurred within the required holding time. The holding time criteria for each of the analyses performed during the Phase II RI are listed below:

Analysis	Holding Time Information
TCL VOCs	Preservation of encore sampler within 48 hours from collection. Analysis must be performed within 7 days from collection.
TCL SVOCs	14 days from collection to extraction; 40 days from extraction to analysis
E&E Constituents	14 days from collection to extraction; 40 days from extraction to analysis
Nitrocellulose	14 days from collection to preparation; 28 days from preparation to analysis
Dioxins/ Dibenzofurans	30 days from collection to extraction; 45 days from extraction to analysis
TAL Metals	180 days from collection to analysis
Mercury	28 days from collection to analysis

All samples were analyzed within the required holding times.

3.2 REVIEW OF CASE NARRATIVE INFORMATION

Summaries of the information provided in the Case Narratives for each SDG are provided below:

- SDG KVM03 – For samples SD-R2-L-5-02D and SD-R2-L-5-01D, the recoveries for the SVOC Laboratory Control Sample (LCS) and/or Laboratory Control Sample Duplicate (LCSD) were outside the QC acceptance limits but biased high. For samples SD-R2-L-5-02D, SD-R2-L-5-01D, SD-R2-K-5-2, and SD-R2-K-5-1, the SVOC reporting limits were elevated due to interference from the sample matrix. For samples SD-R2-L-5-02D, SD-R2-L-5-01D, SD-R2-K-5-2, and SD-R2-K-5-1 the recoveries for the E&E LCS and/or LCSD were outside the QC acceptance limits but biased high.

- SDG KVM04 – For samples SD-R2-M-7-01D, SD-R2-M-7-01D, SD-R2-0-4-1, SD-R2-O-4-2, SD-R2-O-4-3, SD-R2-E-16-1, SD-R2-F-14-1, SD-R2-F-14-2, SD-R2-G-12-1, SD-R2-G-12-3, and SD-R2-D-14-1, the SVOC reporting limits were elevated due to interference from the sample matrix. For samples SD-R2-O-4-1, SD-R2-O-4-2, SD-R2-O-4-3, SD-R2-F-14-1, SD-R2-F-14-2, SD-R2-G-12-1, SD-R2-G-12-3, SD-R2-D-14-1, SD-R2-E16-3, SD-R2-E-16-1, SD-R2-E-16-1D, SD-R2-F-14-2, SD-R2-G-12-1, SD-R2-G-12-3, SD-R2-D-14-1, and DUP-02 the recoveries for the E&E LCS and/or LCSD were outside the QC acceptance limits but biased high. For samples SD-R2-M-7-01D and SD-R2-F-14-1, the HMX in spiking standards was 20 to 25% lower than reported by the manufacturer. For samples SD-R2-G-12-1, SD-R2-D-14-1, SD-R2-O-4-1, SD-R2-O-4-2, SD-R2-O-4-3, SD-R2-M-7-01D, SD-R2-E-16-3, SD-R2-F-14-2, and SD-R2-G-12-3, E&E reporting limits were elevated due to interference from the sample matrix.

- SDG KVM05 – For samples SD-R2-G-12-4, SD-R2-G-12-4_MS, SD-R2-G-12-4_MSD, SD-R2-G-12-5, SD-R2-C-15-2, and SD-R2-C-15-1, SVOC reporting limits were elevated due to interference from the sample matrix. For samples SD-R2-G-12-5, SD-R2-G-12-4_MS, SD-R2-G-12-4_MSD, SD-R2-G-12-5, and SD-R2-C-15-2, the E&E LCS and/or LCSD recoveries for were outside the stated QC window but within the marginal exceedance allowance of +/- 4 standard deviations as defined in the NELAC Standards. The results were accepted based on this allowance.

- SDG KVM06 – For samples SD-R2-E-13-1, D-R2-C-12-6, SD-R2-C-11-1, SD-R2-E-10-1, SD-R2-E-10-1_MS, SD-R2-E-10-1_MSD, and SD-R2-E-10-2, SVOC reporting limits were elevated due to interference from the sample matrix. For samples SD-R2-E-10-2, SD-R2-E-10-1, SD-R2-E-10-1_DUP, SD-R2-E-10-1_MS, and SD-R2-E-10-1_MSD, Metals reporting limits were elevated due to interference from the sample matrix. For E&E samples SD-R2-E-13-1, SD-R2-C-12-6, SD-R2-C-11-1, SD-R2-E-10-1, SD-R2-E-10-1_MS, and SD-R2-E-10-2, the concentration of HMX was low in the spiking standard used for MS/MSD and LCS. For sample SD-R2-C-12-6, E&E reporting limits were elevated due to interference from the sample matrix.

3.2.1 Effects on Data Quality

Based on the review of the Case Narratives, the issues highlighted by the laboratory had the following effect on data quality:

- No data were qualified based on LCS/LSCD recoveries outside of the QC window because they were within the marginal exceedance allowance of +/- 4 standard deviations as defined in the NELAC Standards or resulted in biased high sample results.

- Detection limits were elevated in samples where matrix interference was noted, these data were not qualified

- Where the concentration of HMX was low in the spiking standard, evaluation of the standard indicated the manufacturer's value was 20-25% below their reported concentration. HMX concentrations were subsequently adjusted to compensate for the discrepancy by the laboratory. No additional action is required.

Based on the review, the data are of sufficient quality for use in evaluating site conditions and subsequent actions.

3.3 FIELD AND TRIP BLANK RESULTS

No VOCs, SVOCs or E&E constituents were detected in the field and trip blank samples. Calcium was detected in a field blank sample collected on November 5, 2013 (SDG KVM-04) and analyzed for Metals. Calcium, an essential nutrient commonly found in surface water and groundwater, is not a constituent of concern (COC) at the Facility.

3.4 DUPLICATE SAMPLE RESULTS

Field duplicate analyses were reviewed and are included in data table D-2. Duplicate sediment sample analysis results showed a variability of concentrations, associated with the heterogeneity of the sediment sample matrix. This type of variability is commonly encountered during the analysis of sediment samples. Where duplicate sample data yielded a higher constituent concentration than the original sample, the result from the duplicate sample was compared to the applicable benchmark to assess delineation.

3.5 TENTATIVELY IDENTIFIED COMPOUNDS

Tentatively identified compounds (TICs) were identified in five of the 24 surface water samples collected during the Phase II Sediment RI. The concentrations of SVOC TICs ranged from 68 mg/kg to 57,000 mg/kg. All reported TICs were listed as unknown SVOCs. Targeted SVOCs were detected at concentrations exceeding the LEL or SEL in four of the 24 sediment samples where SVOC TICs were reported. At the remaining sediment sample location, laboratory reporting limits were elevated above the LEL and SEL for select compounds. Suggesting that targeted analytes may be present in the sample but not detectable due to matrix interference. This suggests a link between the presence of SVOCs at concentrations exceeding the LEL and SEL and the presence of SVOC TICs. As constituents of unknown chemical composition, the potential effects (e.g., toxicity) of the TICs on sediment receptors could not be evaluated. Where applicable, TICs will be considered during the remedial action selection process.

4 DRAINAGE AREA DESCRIPTIONS

The Facility has a diverse network of surface water drainage systems that are comprised of both natural and anthropogenic features. The following sections describe the individual drainage areas within the Facility as well as the feature types that make up the drainage areas.

4.1 DRAINAGE AREAS

The drainage network consists of two primary drainage areas – the Northern Drainage Area and Southern Drainage Area. Each of these drainage areas has been further broken down into groups of contributory features. Comingled with the related flowing features of these drainage areas are a number of isolated ponds. The SI and Phase I RI investigated and evaluated drainage features using a subset of five secondary drainage areas, as noted in the following list. Similarly, the ecological risk assessment (ERA) (see Volume F – Ecological Evaluation/Ecological Risk Assessment) uses a tiered approach to evaluate the Facility's drainage network, with the first tier assessing the two primary drainage areas, and a subsequent evaluation focused on tertiary drainages.

The breakdown of the Facility's drainage network is illustrated in the hierarchical tree below.

Drainage Area Distribution

~1ª~	~2ª~	~3ª~
Northern Drainage Area	Duck Pond and Tributaries	Duck Pond
		Eastern Tributary (incl. Shooting Pond)
		Western Tributary
	Miscellaneous Ponds	Northeast Ponds
		Unnamed Ponds
		TNT-PETN-NG Ditches
Southern Drainage Area	Eastern Drainage Area	Central Drainage Basin
		Maintenance-NG Area Ditches
		Maintenance-Dynamite Area Ditches - West
	Central Drainage Area	Development Area Stream
		Maintenance-Dynamite Area Ditches - East
	Western Drainage Area	Miscellaneous Offsite Streams - Upper
		Miscellaneous Offsite Streams - Lower

A description of each drainage area follows.

4.1.1.1.1 Northern Drainage Area

Duck Pond serves as the primary drainage feature in the Northern Drainage Area, receiving water from surrounding stream channels, wetlands, and Shooting Pond. A series of isolated wetlands and pools also exist in the Northern Drainage Area. Flowing features in the Northern Drainage Area flow from offsite onto the Facility.

4.1.1.1.2 Duck Pond and Its Tributaries

Duck Pond encompasses nearly nine acres and is the largest surface water body at the Facility. Duck Pond is a closed system with two inlets and no outlets, and originates within the Facility boundary. One inlet originates in a large wetland near the C&D Landfill and flows east through the Development Area, where it discharges into the northwest corner of Duck Pond. The second inlet originates at Shooting Pond and discharges via a small stream to the northeast corner of Duck Pond. Shooting Pond is the deepest surface water body at the Facility, approximately 15 ft deep in the center. Shooting Pond is stabilized with a sheet pile wall along its western shore

and is armored along its eastern shore with rip-rap. Duck Pond and Shooting Pond are perennial surface water bodies. The tributaries to Duck Pond and Shooting Pond are seasonally intermittent and can be dry during the summer months.

4.1.1.1.3 Miscellaneous Ponds

There are fourteen miscellaneous ponds in the Northern Drainage Area at the Facility. Eleven are located in the Storage Area, two in the Development Area, and one in the Miscellaneous/ Offsite Area. There are no inlets or outlets at any of these ponds, and most are seasonally intermittent.

4.1.1.1.4 Southern Drainage Area

Surface water flows on to the Facility at four discrete locations in the Southern Drainage Area. These features include:

- a small stream channel along the northwestern Facility boundary, near the intersection of Howard Boulevard and Interstate 80 (headwaters of the Eastern Drainage Area described below)
- a man-made ditch through uplands draining stormwater from Howard Boulevard along the western ridgeline adjacent to the TNT and PETN Areas (contributory source of hydrology to the Central Drainage Area described below)
- a man-made ditch within the southern wetland complex draining stormwater from Howard Boulevard (contributory source of hydrology to the Western Drainage Area described below)
- a managed natural stream channel associated with the Black River that drains stormwater from Route 46. This stream enters the facility approximately 1,000-feet east of the intersection of Howard Blvd and Route 46 (contributory source of hydrology to the Western Drainage Area described below)

Overland flow and surface water runoff generally drain in a southeasterly direction via a series of ditches and swales to the southern wetland complex. The Southern Drainage Area receive surface water and suspended sediment from many of the former operational areas of the Facility (i.e., TNT, PETN, NG, AN, Dynamite, Maintenance, Finishing, A-Line, and portions of B-Line and Storage Areas). The Southern Drainage Area also receives offsite stormwater runoff from Howard Boulevard and Route 46 via three of the features listed above. Ultimately the wetland complex drains to a single tributary flowing offsite at the southeastern corner of the Facility approximately 300-feet west of the intersection of Hercules Rd and Route 46. Surface water and sediment data at and proximate to this outlet indicate that Facility-related influences cease upstream of the outlet.

4.1.1.1.5 Eastern Drainage Area

The small headwater stream of the Eastern Drainage Area flows onto the Facility east of the New Jersey Transit Railway (located along the northern boundary of the Facility) and immediately west of the C&D Landfill. The stream flows southwest through the Development Area to Powder Mill Road, where it is then piped underground along the road, flowing through the Finishing Area in a southerly direction. The pipe crosses under Powder Mill Road, emerging above ground near the wastewater treatment plant, and continues southwest through the Maintenance Area and into the Dynamite Area. Tributaries include former process ditches from the B-Line Area and the Maintenance Area. The main channel is perennial, while the tributaries are intermittent. A weir is located in the southern down-gradient portion of the Dynamite Area adjacent to Patrol Road within this drainage area. The weir restricts the flow of sediment from the former manufacturing operations historically performed upgradient. The Eastern Drainage Area converges into the Western and Central Drainage Areas within the Miscellaneous/Offsite Area, in the southern portion of the Facility.

4.1.1.1.6 Central Drainage Area

The Central Drainage Area is formed by an off-site stream that flows generally south from Howard Boulevard. The stream enters the Facility near the existing Morris County Municipal Utilities Authority (MCMUA) water pump station, flows into the Miscellaneous/Offsite Area, and continues through the trinitrotoluene (TNT), Pentaerythritol Tetranitrate (PETN), nitroglycerin (NG), and Dynamite Areas, respectively. Its tributaries consist of smaller streams and former process ditches. Segments of the main stream and tributaries are intermittent and dependent on precipitation events. A weir is located in the southern downgradient portion of the Dynamite Area adjacent to Patrol Road within this drainage area. The weir restricts the flow of sediment from the former manufacturing operations historically performed upgradient.

4.1.1.1.7 Western Drainage Area

The Western Drainage Area originates from one drainage ditch and one stream that flow into the southwest corner of the Facility. The drainage ditch directs surface water east from Howard Boulevard, approximately 300 feet north of the intersection of Howard Boulevard with Route 46, discharging into wetland and is derived from surface water runoff from the adjacent shopping center. The stream flows north from Route 46 approximately 1,000 feet east from the intersection of Howard Boulevard with Route 46. The primary channel turns east and is joined by the Central and Eastern Drainage Areas. From the confluence of the Central, Western, and Eastern Drainage Areas, the channel flows southward and exits the Facility at Route 46, approximately 300 feet west of the intersection of Route 46 with Hercules Road. This is the only location where surface water and sediment exit the Facility. The channels and the majority of the tributaries of the Western Drainage Area are perennial streams, carrying surface water throughout the year.

4.1.1.1.8 Miscellaneous Ponds

There are two miscellaneous ponds in the Southern Drainage Area at the Facility located in the NG Area. Alterations to the management of process water at the Facility in the 1970s altered the source of hydrology to these ponds. Since that time they have transitioned to ephemeral wetlands and rarely hold standing water.

4.2 SURFACE WATER FEATURE TYPES

Aquatic features within the drainage areas described in Section 4.1 consist of the four feature types described below.

- Intermittent Streams
- Streams
- Wetland Areas
- Ponds

Many of the drainage systems incorporate combinations of the surface water feature types listed above. However, every drainage system does not possess all of the identified surface water feature types.

Intermittent Streams

Intermittent streams are similar to streams, but are typically smaller and do not convey water during the entire year, a consequence of being primarily influenced by precipitation. Intermittent streams generally act as tributaries to other streams during seasonal periods of high precipitation. Many former process ditch remnants are classified as intermittent streams.

Streams

Streams are characterized as channelized bodies of water that have bed and bank, and flow through the Site. They are generally less than 5 ft wide and less than 2 ft deep. Streams are typically perennial and are dry only during periods of severe drought. They are fed by groundwater, precipitation, and/or overland runoff.

Wetland Areas

Wetlands at the Site are typically characterized by low lying areas and topographic depressions that are frequently saturated and often contain some degree of seasonally variable surface water. The most common wetland types observed at the Site during the sampling effort were bogs and swamps.

Ponds

Ponds are characterized as depressions in the ground that retain surface water. The majority of the ponds at the Site (with the exception of Duck Pond and Shooting Pond) are generally less than 50 ft in diameter and less than 2 ft deep. Most of the Site ponds fluctuate significantly in water level due to variations in seasonal precipitation. Duck Pond and Shooting Pond have been historically modified during Site development, and are much larger and deeper than the other ponds on the Site.

4.3 SUMMARY

The breakdown of the Facility's drainage features facilitated the initial characterization of surface water and sediment quality in the Phase I RI and the focused evaluations of aquatic receptors provided in the Ecological Evaluation/Ecological Risk Assessment (Volume F). The categorization of drainage area features into feature types enables the development of organic carbon normalized sediment quality benchmarks using organic carbon value averages based on a dataset collected from features with similar flow regimes and sediment characteristics.

For the purposes of evaluating overall RI objectives (i.e., horizontal and vertical delineation, characterization of sediment quality) a Facility-wide approach was taken. Where applicable, drainage areas provide context to the Facility-wide evaluation and feature types support development of the conceptual site model as it relates to constituents in sediment and their associated fate and transport.

5 RESULTS

The Phase II Sediment-RI was implemented in the Fall of 2013 by OBG, in accordance with the Phase II Remedial Investigation Memorandum (OBG, 2013). The Phase II Sediment RI included the collection of 26 sediment samples from 24 locations. These 26 samples supplement the SI/Phase I RI sediment dataset (560 sediment samples).

Sections 5.3.1 through 5.3.3 evaluate the Phase II RI sediment data in the context of specific Phase II RI objectives presented in Section 2.0. The Phase II objectives focus on filling data gaps identified following the Phase I RI and address NJDEP comments regarding the magnitude and extent of Facility-related influences on sediment quality in select locations.

Section 5.3.4 incorporates the Phase II RI sediment data into the comprehensive site wide sediment characterization dataset for the purposes of fulfilling overall RI objectives in accordance with the TRSR. The overall RI data evaluation employs a site-wide, holistic approach to demonstrate horizontal and vertical delineation of Facility-related influences on sediment quality.

The following tables and figures support the data evaluations that follow.

- Tables
  - Phase II RI Analytical Methods and Criteria Summary are presented in Table D-1
  - Phase II RI Sediment - Analytical Results are presented in Table D-2
- Figures
  - Figure D-1 presents the Phase II RI sediment sample locations
  - Figure D-2 presents the Phase II RI sediment sample analytical results
  - Figure D-3 presents the composite areal extent of exceedances of the LEL and SEL inclusive of all analytical groups
  - Figures D-4 through D-31 present the facility-wide Sediment RI results for specific COCs and analyte groups

5.1 SEDIMENT QUALITY BENCHMARKS

This section presents the sources and hierarchical selection of sediment quality benchmarks used as comparison criteria during the evaluation of SI, Phase I RI, and Phase II RI sediment data. The NJDEP's Ecological Screening Criteria (ESC) table (NJDEP 2009) served as the primary source of benchmarks. This table consolidates benchmark values from a variety of sources, often resulting in multiple benchmark values for the same constituent. Where multiple values were presented in the ESC table, the most conservative value was selected for use in establishing delineation of Facility-related constituents in sediment. Where the ESC table did not provide a benchmark, values from other nationally-recognized sources were used.

Sediment quality benchmarks were preferentially selected from the following sources:

- NJDEP ESC Table (March 10, 2009) – Sediment – Fresh Water Criteria - Lowest Effects Level (LEL) and Severe Effects Level (SEL) values. Source of these values include Persaud et al. (1993), USEPA Region 5 RCRA Ecological Screening Levels (USEPA 2003), and the NOAA Screening Quick Reference Table (NOAA 2008).

  USEPA Region 3 Biological Technical Assistance Group Freshwater Sediment Screening Benchmark (USEPA 2006) for Hexahydro-1,3,5-Trinitro-1,3,5-Triazine (RDX), sourced from Talmadge et al. (1999).

- *Munition constituents: Preliminary sediment screening criteria for the protection of marine benthic invertebrates* Pascoe et al. (2010) for 1,3,5-Trinitrobenzene and Octahydro-1,3,5,7-Tetranitro-1,3,5,7-Tetrazocine (HMX).

For the purpose of this report, the terms LEL and SEL are used as collective terms and encompass the aforementioned benchmark sources as a whole, where applicable. Generally speaking, LELs represent constituent concentrations at or below which effects to target receptor populations (typically benthic invertebrates for sediment benchmarks) are unlikely to occur. Whereas, SELs represent constituent concentrations at which effects to a significant portion (typically 50 or 90 percent) of a target receptor population are expected to occur. Discussion associated with achieving delineation focuses on the LEL benchmarks. Together with the LEL, the SEL benchmarks establish a bounded range that provides context to the magnitude of constituent concentrations.

SEL benchmarks for PAHs provided in the ESC table are based on 100 percent organic carbon, and require normalization to site-specific organic carbon values. As discussed in Section 4, the aquatic features at the Facility have been segregated among four categories based on the feature conditions (i.e., intermittent streams, streams, wet areas, and ponds). Average organic carbon values were calculated for each feature type to support the calculation of feature-specific SELs. The table below summarizes the calculated SELs. Complete SEL calculations for PAHs are provided in Appendix E.

PAH Constituent	Calculated SEL (mg/kg)			
	Intermittent Streams (14,569 mg/kg TOC)	**Streams** (16,393 mg/kg TOC)	**Wet Areas** (31,171 mg/kg TOC)	**Ponds** (48,975 mg/kg TOC)
Acenaphthene	0.007	0.008	0.02	0.02
Acenaphthylene	0.009	0.01	0.02	0.03
Anthracene	5.4	6.1	11.5	18.1
Benzo(a)anthracene	21.6	24.3	46.1	72.5
Benzo(b)flouranthene	26.2	29.5	56.1	88.2
Benzo(a)pyrene	21.0	23.6	44.9	70.5
Benzo(g,h,i)perylene	4.7	5.2	10.0	15.7
Benzo(k)fluoranthene	19.5	22.0	41.8	65.6
Chrysene	6.7	7.5	14.3	22.5
Dibenz(a,h)anthracene	1.9	2.1	4.1	6.4
Fluoranthene	14.9	16.7	31.8	50.0
Fluorene	2.3	2.6	5.0	7.8
Indeno(1,2,3-c,d)pyrene	4.7	5.2	10.0	15.7
Phenanthrene	13.8	15.6	29.6	46.5
Pyrene	12.4	13.9	26.5	41.6

Similarly, E&E benchmarks from Pascoe et al. (2010) require organic carbon normalization. The table below summarizes the low (LEL) and high (SEL) range benchmarks calculated for each feature type.

E&E Constituent	Calculated Benchmarks (LEL [SEL], µg/kg)			
	Intermittent Streams (14,569 mg/kg TOC)	**Streams** (16,393 mg/kg TOC)	**Wet Areas** (31,171 mg/kg TOC)	**Ponds** (48,975 mg/kg TOC)
1,3,5-Trinitrobenzene	2.33 [12.4]	2.62 [13.9]	4.99 [26.5]	7.84 [41.6]
Octahydro-1,3,5,7-Tetranitro-1,3,5,7-Tetrazocine (HMX)	5.54 [625]	6.23 [703]	11.8 [1,337]	18.6 [2,101]

A number of sediment quality benchmarks have changed since the preparation of the SI and Phase I RI reports. These changes are attributable to regulatory updates, average TOC value changes based on additional sampling data, and identification and incorporation of alternative sources where NJDEP does not provide ESC. Table D-1 presents the sediment quality benchmarks used in this volume of the Phase II RIR. For the purposes of evaluating overall RI objectives (Section 5.4 and Figures D-3 through D-31), these benchmarks have been applied to SI, Phase I RI, and Phase II RI results. Updated SI and RI sediment data tables are provided in Appendix G.

5.2 CONSTITUENT INFLUENCES UNRELATED TO HISTORICAL FACILITY OPERATIONS

Historical facility operations influenced sediment quality in Facility surface-water features via historical material management and disposal processes prior to the advent of environmental regulations (e.g., RCRA) and/or waste reclamation technologies (e.g., spent acid recovery), as well as via accidental releases associated with process upsets (e.g., 1940 explosion). Beyond these operational influences, historical onsite and offsite development have also influenced sediment quality.

Historical Facility development and improvement made use of historic fill materials (a common practice in the late 1800s and early 1900s) including fly ash, bottom ash, and slag as fill material (historic fill) generated by the local iron ore processing industry to improve the grade of the Facility, recover unusable land, and establish numerous narrow gauge rail beds and roadways. Areas of historic fill material were mapped as part of the SI, and further characterized with regards to their constituent makeup (i.e., PAHs and Metals) during the RI. Alterations to the Facility drainage networks associated with further development resulted in ditches cut through the placed historic fill material. Changes in flow regimes and ditch hydrology attributable to precipitation runoff and non-contact process water use at the Facility had the potential to erode the bed and bank of the ditches and distribute historic fill materials throughout the drainage network. Often, the ditches drained to a central drainage feature or pooled area, where water velocity slowed and suspended sediment (including historic fill) deposited and accumulated over time.

Areas adjacent to and surrounding the Facility grew along with the Facility. Over time, roadway improvements and stormwater management practices associated with municipal growth have influenced sediment quality in aquatic features around the undeveloped perimeter of the Facility. These influences are evident where ditches draining Howard Boulevard and Route 46 flow onto the Facility and in stormwater management basins onsite receiving runoff from adjacent landowners (e.g., NJ Transit). Localized influences attributable to stormwater are also occurring where the Facility's southern drainage area exits the Facility through a culvert beneath Route 46. Characterization of sediment quality at the Facility during the SI/RI included areas influenced by historic fill and offsite sources. Sediment samples located within these areas represent (8 percent) of the total number of sediment samples characterizing sediment quality at the Facility (586 samples). However, this small group of samples along the perimeter of the Facility also represents the majority of locations at which delineation appears incomplete. A discussion of these samples as they relate to the overall characterization of Facility-related influences on sediment quality follows.

- A series of sediment samples characterized ditches flowing onto the Facility from Howard Boulevard and Route 46 in the Western Drainage Area (grid cells A15, B14/15/16, C15/16). The ditches traverse a forested wetland undeveloped during the operational history of the Facility, ditch sediment sample locations occur upgradient of the confluence with ditches draining former operational areas. At 23 sample locations in upgradient ditches Metals and PAHs were detected at concentrations greater than their respective LELs. Despite the close proximity to the TNT and Dynamite Areas where E&E constituent detections are most prevalent, E&E constituents were not detected at concentrations exceeding their respective LELs in these upgradient drainage sediment samples. A number of light industrial properties border Route 46 (to the south) and the wetland complex (to the north). Given the hydrology of these ditches, constituents and concentrations detected in sediment, and absence of historical Facility operations in the area, it is reasonable to conclude that the concentrations of Metals and PAHs identified in sediment at these locations are attributable to stormwater runoff from Howard Boulevard and Route 46, and unrelated to Facility operations.

- A series of sediment samples were collected from a linear ditch draining stormwater runoff from Howard Boulevard atop the western ridgeline (grid cells B8 and C9). The three most upgradient sample (nearest to Howard Boulevard) had concentrations of Metals and PAHs exceeding their respective LELs. Constituent concentrations in two additional downgradient samples located upgradient of former operational areas did not exceed LELs. Topographically, this ditch drains down an undeveloped ridgeline and enters former operational areas of the Facility at an elevation approximately 20 to 40 feet below the elevation of the three upgradient sample locations. Concentrations were highest at the location nearest to Howard Boulevard. Given the constituents detected, concentration trends, and upgradient location relative to former operational areas, it is reasonable to conclude that the concentrations of Metals and PAHs identified in sediment are attributable to stormwater runoff from Howard Boulevard and unrelated to Facility operations.

- Three sediment samples were collected from a stormwater management feature adjacent to the former Facility entrance along Howard Boulevard (grid cell H5). Metals and PAH concentrations in each sample exceeded their respective LELs. Topographically, this feature is at a higher elevation than the surrounding areas in the Development Area and lower than Howard Boulevard, and a former entrance/parking area (impervious surface) spans the area between Howard Boulevard and the stormwater feature. Further, a portion of the stormwater runoff generated by the recently-constructed NJ Transit Mount Arlington Train Station flows through this feature. Given the current and historical role of the feature, as well as its location (geographically and topographically) relative to offsite sources, it is reasonable to conclude that the concentrations of Metals and PAHs identified in sediment are attributable to stormwater runoff from Howard Boulevard and unrelated to Facility operations.

- A series of sediment samples were collected to characterize sediment quality in three isolated ponds along the Facility perimeter road and NJ Transit rail line (grid cells K4/5 and O4). Metals concentrations in seventeen samples exceeded their corresponding LELs, and zinc concentrations in one sediment sample exceeded the SEL. Two PAHs, pyrene and fluoranthene, were also detected in the largest of the three ponds at concentrations exceeding their LELs. These isolated ponds occur on the Facility side of the perimeter road and drain wetlands that have formed in the valley between the perimeter road and the NJ Transit rail line. The rail line was constructed as part of the Lackawanna and Western Railroad in the mid-1800s. Construction used wooden ties coated in creosote (a potential source of PAHs), and likely relied on nearby sources of ash and slag as bedding material to create the rail bed. Upon construction of the Facility's perimeter security road at the beginning of World War II, the wetlands existing adjacent to the rail corridor were traversed by the road bed and the flow of water channeled beneath the road via culverts leading to the isolated ponds. Given the construction, maintenance and long-term operational history of the rail line as well as the drainage patterns created by the construction of the perimeter security road, it is reasonable to conclude that the concentrations of Metals and PAHs identified in sediment are unrelated to Facility operations.

- Surface water flowing through the Western Drainage Area drains offsite through a culvert beneath Route 46. Two tributaries feed the ditch that drains offsite. The most upgradient tributary is a combination of flow from

various drainage areas within the TNT, Dynamite, Maintenance, AN, and A-Line, and Development Areas. The other tributary drains western portions of the drainage consisting primarily of stormwater that runs onto the facility via ditches from Howard Boulevard and Route 46. At the confluence of the ditch and culvert, Metals and PAHs were detected at concentrations exceeding their respective LELs. However, multiple upgradient sediment samples collected from locations downgradient of the confluence with the ditch draining the former operational areas of the Facility do not identify Metals or PAHs at concentrations exceeding their respective LELs. Given the length of ditch possessing sediment absent influences from the Facility, and the localized nature of the concentrations exceeding LELs in proximity to Route 46 stormwater outfalls, it is reasonable to conclude that the concentrations of Metals and PAHs identified in sediment are attributable to stormwater runoff from Route 46 and unrelated to Facility operations.

Appendix F provides a list of the specific sample locations included in the features referenced above.

Based on the information provided, offsite influences on sediment quality are believed to represent sources related to stormwater runoff and historical offsite sources. The sections that follow evaluate the Phase II RI data relative to Phase II RI objectives and the comprehensive sediment characterization dataset relative to overall RI objectives. The discussion is organized by constituent class, with discussions specific to individual constituents where applicable. Rather than address each of the locations discussed herein as part of the evaluation of delineation for each constituent, a general reference to the information presented in this section will be included.

5.3 PHASE II RESULTS

The Phase II Sediment RI sampling locations are indicated on Figure D-1. The results of the laboratory analysis of the sediment samples are presented on Table D-2. Figure D-2 graphically presents the results of the analysis of sediment samples collected during the Phase II Sediment-RI. Figure D-3 depicts the extent of sediment LEL and SEL exceedances.

The following sections evaluate Phase II RI sediment data in the context of the specific Phase II RI objectives. Additional evaluation of these results occurs as part of the Facility-wide characterization dataset in Section 5.3, as well as in Volume – F – Ecological Evaluation / Ecological Risk Assessment.

5.3.1 Evaluation of Sediment Quality Outside Stream Channels in Wetland Areas

Twenty (20) sediment samples were collected from the following locations and analyzed for SVOCs, Metals, and E&E constituents to evaluate sediment quality outside of defined stream channels within wetland areas:

- SD-R2-G-12-1
- SD-R2-G-12-3
- SD-R2-G-12-4
- SD-R2-G-12-5
- SD-R2-F-14-1
- SD-R2-F-14-2
- SD-R2-E-13-1
- SD-R2-D-14-1
- SD-R2-C-12-6
- SD-R2-C-11-1
- SD-R2-C-15-1
- SD-R2-C-15-2
- SD-R2-K-5-1
- SD-R2-K-5-2
- SD-R2-O-4-1
- SD-R2-O-4-2
- SD-R2-E-16-3
- SD-R2-E-10-1
- SD-R2-E-10-2
- SD-R2-O-4-3

5.3.1.1 SVOCs

The following SVOCs were detected at concentrations exceeding their respective LELs in 12 of the 20 sediment samples. There were no exceedances of the SEL at these locations.

- 2-Methylnaphthalene
- Acenaphthene
- Acenaphthylene
- Anthracene
- Benzo(a)anthracene
- Benzo(a)pyrene
- Benzo(g,h,i)perylene
- Benzo(k)fluoranthene
- Chrysene
- Dibenzo(a,h)anthracene
- Fluoranthene
- Fluorene
- Indeno(1,2,3-c,d)pyrene
- Naphthalene
- Phenanthrene
- Pyrene

Anthracene, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(g,h,i)perylene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-c,d)pyrene, Phenanthrene, and Pyrene are PAHs commonly found in the samples collected from the historic fill emplaced at the Facility.

LEL exceedances were noted at the following locations:

- As indicated in Figure D-2, the following six samples with LEL exceedances are located in or adjacent to historic fill:
  - SD-R2-G-12-1
  - SD-R2-G-12-3
  - SD-R2-G-12-4
  - SD-R2-G-12-5
  - SD-R2-E-10-1
  - SD-R2-E-10-2

- The following three samples with LEL exceedances are located adjacent to stream channels where LEL exceedances were previously identified:
  - SD-R2-F-14-1
  - SD-R2-F-14-2
  - SD-R2-C-15-1

- The following two samples with LEL exceedances are located in wetland areas away from stream channels, historic fill, and adjacent to stream channels where LEL and/or SEL exceedances were previously identified:
  - SD-R2-E13-1 – down gradient of historic fill
  - SD-R2-K-5-1 – in the vicinity of the former Experimental Dynamite Area

- One sample with LEL exceedances (SD-R2-O-4-1) is located adjacent to the NJ Transit rail line. PAHs at this location are believed to represent off-site contributions (see discussion in Section 5.2)

5.3.1.2 Metals

The following Metal constituents were detected at concentrations exceeding their respective LEL or SELs in the 20 samples collected from outside of defined stream channels The laboratory analysis of these samples indicated exceedances of the LEL at 20 sample locations and exceedance of the SEL at 10 locations.

- Antimony - LEL and SEL
- Arsenic- LEL and SEL
- Cadmium- LEL
- Chromium- LEL and SEL
- Copper- LEL and SEL
- Lead- LEL
- Manganese- LEL and SEL

- Mercury- LEL and SEL
- Nickel- LEL
- Silver- LEL
- Zinc- LEL

As indicated on Figure D1, the following constituents exceeded their respective SELs at the eight sediment sample locations listed below.

- SD-R2-G-12-1 (lead and mercury)
- SD-R2-G-12-4 (manganese and mercury)
- SD-R2-G-12-5 (mercury)
- SD-R2-C-12-6 (lead)
- SD-R2-C-11-1 (antimony, arsenic, and lead)
- SD-R2-E-10-1 (lead and manganese)
- SD-R2-E-10-2 (arsenic)
- SD-R2-D-14-1(manganese)

With the exception of SD-R2-C-12-6 and SD-R2-C-11-1, these sediment samples were collected from locations adjacent to culverts passing beneath a former narrow gauge rail bed and roadway. The elevated base of the rail bed and roadway, as well as the bedding material that the culverts pass through are constructed of historic fill material.

Sediment samples SD-R2-C-12-6 and SD-R2-C-11-1 were collected from former drainage features that collected stormwater runoff from the adjacent, upgradient TNT, NG, and PETN areas that utilized acid in the manufacturing process. Currently, these features exist as an intermittently inundated wetland (SD-R2-C-11-1) and a dry stream segment with saturated bed sediment (SD-R2-C-12-6) fed primarily by precipitation and localized overland flow of runoff.

The following two samples with SEL exceedances are located adjacent to stream channels where LEL exceedances were previously identified within the existing channel.

- SD-R2- F-14-1 (chromium, lead, and mercury)
- SD-R2- F-14-2 (lead and mercury)

Historically this area was managed as a depositional pool with a weir located at the outlet end for the purpose of capturing Facility related constituents prior to exiting the operational portion of the Facility. Changes to hydrology associated with the cessation of Facility operations (e.g., WWTP discharges, managed stormwater) has reduced flow through this area, enabling shallow depositional areas to transition to fringing wetland habitats and the former pool to revert to a channelized ditch.

5.3.1.3 E&E Constituents

E&E constituents were not detected at concentrations exceeding their respective LELs at the sampled locations from outside of defined stream channels.

5.3.1.4 General Conclusions

There were exceedances of the LEL or SEL in all 20 sediment samples collected from outside of defined stream channels. Of these 20 locations, eight samples (SD-R2-G-12-1, SD-R2-G-12-3, SD-R2-G-12-4, SD-R2-G-12-5, SD-R2-C-12-6, SD-R2-C-11-1, SD-R2-E-10-1, SD-R2-E-10-2) were located in or adjacent to historic fill material. The presence of PAHs and Metals in sediment at these locations is attributed to the presence of historic fill in close proximity to the sample locations. PAHs and Metals were also detected in three sediment samples (SD-R2-F-14-1, SD-R2-F-14-2, SD-R2-C-15-1) located adjacent to stream channels that were down gradient of historic fill.

At five sediment sample locations in the interior of the Facility in wetland areas away from stream channels and historic fill (SD-R2-C-15-2, SD-R2-D-14-1, SD-R2-E-13-1, SD-R2-0-4-2, SD-R2-0-4-3), the presence of PAHs and Metals exceeding the LELs is attributed to storm runoff from areas where historic fill was emplaced.

At two locations outside of defined stream channels (SD-R2-K-5-1, SD-R2-K-5-2), the presence of PAHs and Metals at concentrations exceeding the LEL is attributed to former operations in Experimental Dynamite Area.

The presence of PAHs and Metals in sediment samples collected from locations adjacent to Route 46 (SD-R2-E-16-3) and the NJ transit line (SD-R2-O-4-1) at concentrations exceeding the LEL are attributed to off-site influences, as discussed in Section 5.2. The absence of E&E constituents at concentrations exceeding the LEL at these locations further supports the conclusion that PAHs and Metals present in sediments outside defined streamed channels at concentrations exceeding the LEL and SEL are unrelated to Facility operations.

5.3.2 Relationship between Surface Water and Sediment

Co-located surface water and sediment samples were collected within the former operational areas of the Facility during the Phase II RI in an effort to evaluate the influence of COCs in sediment on overlying surface water. A total of 15 co-located surface water/sediment sample locations were proposed as part of the Phase II RI Memorandum (OBG, 2013). However, the lack of surface water present during sampling reduced the number of sample locations to 7. The co-located sample locations used to evaluate the relationship between surface water and sediment are as follows:

- SW-R2-B-15-1 and SD-R2-C-15-1
- SW-R2-B-15-2 and SD-R2-C-15-2
- SW-R2-E-16-1 and SD-R2-E-16-1
- SW-R2-E-16-3 and SD-R2-E-16-3
- SW-R2-F-14-1 and SD-R2-F-14-1
- SW-R2-F-14-2 and SD-R2-F-14-2
- SW-R2-G-12-2 and SD-R2-G-12-3

Note: co-located surface water samples SW-R2-B-15-1 and SW-R2-B-15-2 were collected from grid C-15. These samples were erroneously labeled in the Phase II RI Memorandum.

Surface water and sediment samples collected from co-located areas were analyzed for SVOCs, Metals, and a single E&E constituent.

5.3.2.1 SVOCs

SVOCs, limited to a subset of PAHs, were detected in sediment, but not in surface water at five (SW-R2-E-16-1, SW-R2-E-16-3, SW-R2-F-14-1, SW-R2-F-14-2, SW-R2-G-12-2) of the seven co-located sample locations. At one location (SW-R2-B-15-1), SVOCs were detected in surface water and sediment. Additionally, SVOCs were detected in surface water, but not in sediment at one of the seven co-located sample locations (SW-R2-B-15-2/SD-R2-C-15-2).

A summary of the SVOCs detected at these locations and the matrices in which they were detected is provided below (Table D-3):

- 2-Methylnaphthalene (sediment only)
- Acenaphthene (sediment only)
- Acenaphthylene (sediment only)
- Anthracene (sediment only)
- Benzo(a)anthracene (surface water and sediment)
- Benzo(a)pyrene (surface water and sediment)
- Benzo(b)fluoranthene (surface water and sediment)
- Benzo(g,h,i)perylene (surface water and sediment)
- Benzo(k)fluoranthene (surface water and sediment)
- Chrysene (surface water and sediment)
- Fluoranthene (surface water and sediment)
- Indeno(1,2,3-c,d)pyrene (surface water and sediment)
- Phenanthrene (surface water and sediment)
- Pyrene (surface water and sediment)

Concentrations of SVOCs were greater in sediment samples compared to surface water. These findings are consistent with the physiochemical properties of the detected constituents, as PAHs have an affinity to bind to organic carbon in sediment rather than partition to the aqueous phase. At the single sample location where an SVOC was detected in co-located surface water and sediment, the concentration in the surface water sample was four orders of magnitude lower than the concentration in the sediment sample. This indicates minimal partitioning of SVOCs from sediment to surface water. In the location where SVOCs were detected in surface water but not sediment, there were elevated detection limits for the sediment sample. As such, an evaluation of a relationship between surface-water and sediment concentrations could not be quantified. As discussed in Section 5.2 the location where SVOCs were detected in a co-located surface water and sediment sample receives runoff from adjacent Route 46.

5.3.2.2 Metals

Metals were detected in co-located surface water and sediment samples. With the exception of antimony, each constituent was detected in sediment. The constituents detected in sediment were also detected in surface water, with the exception of beryllium, selenium and silver. A summary of the Metals detected at these locations and the matrices in which they were detected is provided below (Table D-3):

- Aluminum (surface water and sediment)
- Antimony (surface water only)
- Arsenic (surface water and sediment)
- Barium (surface water and sediment)
- Beryllium (sediment only)
- Cadmium (surface water and sediment)
- Calcium (surface water and sediment)
- Chromium (surface water and sediment)
- Cobalt (surface water and sediment)
- Copper (surface water and sediment)

- Iron (surface water and sediment)
- Lead (surface water and sediment)
- Magnesium (surface water and sediment)
- Manganese (surface water and sediment)
- Mercury (surface water and sediment)
- Nickel (surface water and sediment)
- Potassium (surface water and sediment)
- Selenium (sediment only)
- Silver (sediment only)
- Vanadium (surface water and sediment)
- Zinc (surface water and sediment)

Beryllium, selenium, and silver were detected in sediment and not in surface water, indicating these constituents are not partitioning from sediment to surface water. Barium, calcium, iron, magnesium, and manganese were detected in both surface water and sediment samples from each co-location. These Metals are essential nutrients common to surface water and commonly found in the earth's crust. Manganese concentrations in sediment did not exceed its LEL, and LELs/SELs are unavailable for barium, calcium, iron and magnesium. Similarly, barium was not detected in surface water at concentrations exceeding it surface water quality standard, and surface water quality standards are unavailable for calcium, iron, magnesium, and manganese,

The remaining Metals were detected at varying frequencies between surface water and sediment. Note that antimony was detected only in a single surface water sample (SW-R2-B-15-2) and was not detected in sediment. The concentrations of the Metals detected in sediment were typically two to five orders of magnitude higher in sediment than in surface water. This indicates minimal partitioning of Metals from sediment to surface water.

5.3.2.3 E&E Constituents

A single E&E constituent (4-amino-2,6-dinitrotoluene) was detected in surface water at two locations (SW-R2-E-16-1 and SW-R2-E16-3) at four order of magnitude below its corresponding surface water quality comparison criteria, and not detected in the corresponding sediment samples. These findings in sediment are consistent with five additional Phase I RI sediment samples collected in close proximity to the Phase II RI co-located surface water and sediment samples. The E&E constituent detected in surface water is discussed further in Volume D – Phase II Surface Water RI Report.

5.3.2.4 General Conclusions

SVOCs were detected in sediment, but not in surface water at five of the seven co-located sample points. At two of the seven co-located sample points SVOCs were detected in surface water. However, where an SVOC was detected in both the surface water and sediment, the concentrations in the surface water sample were four orders of magnitude lower than the concentrations in the sediment sample. This indicates minimal partitioning of SVOCs from sediment to surface water. Additionally, the location where SVOCs were detected in both surface water and sediment samples receives runoff from adjacent Route 46, the presence of SVOCs at this location is not believed to be a result of site activities as discussed in Section 5.2.

Beryllium, selenium, and silver were detected in sediment and not in surface water, indicating these constituents are not partitioning from sediment to surface water. Arsenic, cadmium, chromium, cobalt, copper, lead, mercury, nickel, vanadium, and zinc were detected in surface water and sediment. However, the concentrations of the Metals detected in sediment were typically three to five orders of magnitude higher than in sediment than in surface water. This indicates minimal partitioning of Metals from sediment to surface water. Aluminum, barium, calcium, iron, magnesium, potassium, and manganese were detected in both surface water and sediment samples from each co-location. As indicated in *Elemental Concentrations in Soil and Other Surficial Materials of the*

Counterminous United States, USGS Professional Paper 720, 1984 (USGS, 1984), these Metals are commonly found in surficial geologic materials in the vicinity of the Facility.

E&E constituents were not detected in sediment samples collected from the seven co-located sample points. The E&E constituent 4-amino-2,6-dinitrotoluene was detected in two of the seven co-located sample points at concentrations below its most stringent criteria. The meaning of this finding is discussed further in Volume D – Phase II Surface Water RIR.

5.3.3 Evaluation of Vertical Delineation Results

Sediment samples were collected within the former operational areas of the Facility during the Phase II Sediment RI in an effort to delineate the vertical extent of sediment quality at the following five locations:

- SD-R2-E-16-1 (depth 0 to 0.5 ft.)
- SD-R2-E-16-1D (depth 2 to 2.5 ft.)
- SD-R2-M-7-01D (depth 2.5 to 3 ft.) – corresponding to sample location SD-R-M-7-01 of Phase I RI
- SD-R2-L-5-01D (depth 2.5 to 3 ft.) – corresponding to sample location SD-R-L-5-01 of Phase I RI
- SD-R2-L-5-02D (depth 2.5 to 3 ft.) – corresponding to sample location SD-R-L-5-02 of Phase I RI

Sediment samples were analyzed for VOCs (locations SD-R2-E-16-1 and SD-R2-E-16-1D only), SVOCs, Metals, and E&E constituents. The following section presents the constituents and number of exceedances of the LEL or SEL at these locations.

Based on the description of the samples collected at locations SD-R2-E-16-1D (construction fill material composed of pebbly, gravely silt with trace fine sand and no organic matter) and SD-R2-M-7-01D (glacial till material composed of clay with some sand and no organic matter), it appears that these delineation samples were collected from below the depositional sediment layer and the physical (vertical) limit of sediment has been defined.

5.3.3.1 VOCs

A total of two VOC samples were analyzed to delineate vertical sediment quality at sample locations SD-R2-E-16-1 and SD-R2-E-16-1D. No VOCs were detected that exceeded the LEL and/or SEL at these sediment sample locations. Vertical delineation of VOCs in sediment is complete.

5.3.3.2 SVOCs

A total of five SVOC samples were collected and analyzed to delineate vertical sediment quality during the Phase II RI. The results of these activities are discussed below.

At sample location SD-R2-E-16-1/ SD-R2-E-16-1D no SVOCs were detected in the surface sample. However, the following SVOCs were detected at concentrations exceeding their respective LELs at the deep interval:

- Acenaphthene
- Acenaphthylene
- Benzo(a)anthracene
- Benzo(g,h,i)perylene
- Chrysene
- Fluoranthene
- Phenanthrene
- Pyrene

Vertical delineation of SVOCs was not accomplished at this location. However, as this sampling point is adjacent to Route 46, the presence of PAHs at concentrations exceeding their respective LELs at this location is interpreted to not be associated with Facility operations. However, as this sampling point is adjacent to Route 46, the presence of SVOCs at concentrations exceeding the LEL at this location is interpreted to be the result of excavating and grading activities associated with road construction and maintenance over time.

At previous sample location SD-R-M-7-01, ten PAHs exceeded LEL benchmarks at a depth of 0.5-1 ft. At vertical delineation sample location SD-R2-M-7-01D, no SVOCs were detected. Vertical delineation of SVOCs at this location has been completed.

At previous sample location SD-R-L-5-01, three SVOCs (benzo[a]pyrene, benzo[k][fluoranthene, and 2,4-dinitrotoluene) exceeded the LEL at a depth of 0.5-1 ft. At vertical delineation sample location SD-R2-L-5-01D, benzo[a]pyrene was detected at a concentration exceeding the LEL, while the remaining two constituents were not detected at detection limits exceeding the LEL. Vertical delineation of SVOCs at this location remains incomplete. However, the LEL is a screening benchmark developed to be protective of benthic invertebrate communities occupying the biologically active zone in sediment (conservatively established as 0-12 inches for this Facility). The lower sample interval occurs approximately 1.5 feet below the biologically-active zone and this area will be addressed via active remediation in association with the adjacent old burning grounds (M5-3). Delineation in this area will be completed as part the remedy.

At sample location SD-R-L-5-02, one SVOC (2,4-dinitrotoluene) exceeded the LEL at a depth of 0.5-1 ft. At vertical delineation sample location SD-R2-L-5-02D, dibenzo(a,h)anthracene was detected at a concentration exceeding the LEL and 2,4-dinitrotoluene was non-detect at a detection limit that exceeded the LEL. Vertical delineation of SVOCs at this location remains incomplete. However, the LEL is a screening benchmark developed to be protective of benthic invertebrate communities occupying the biologically active zone in sediment. The lower sample interval occurs approximately 1.5 feet below the biologically-active zone and this area will be addressed via active remediation in association with the adjacent old burning grounds (M5-3). Delineation in this area will be completed as part the remedy.

5.3.3.3 Metals

Five samples were collected and analyzed for Metals to delineate vertical sediment quality during the Phase II RI. The results of these activities are discussed below.

At sample location SD-R2-E-16-1/ SD-R2-E-16-1D the following Metals were detected at concentrations exceeding the LEL:

- Copper
- Lead

The concentrations of these Metals increased slightly with depth. Vertical delineation of Metals was not accomplished at this location. However, as this sampling point is adjacent to Route 46, the presence of lead and copper at concentrations exceeding the LEL at this location is interpreted to not be associated with Facility operations.

At previous sample location SD-R-M-7-01, there Metals (copper, lead and mercury) exceeded their respective LELs at a depth of 0.5-1 ft. At vertical delineation sample location SD-R2-M-7-01D the following Metals exceeded the LEL:

- Aluminum
- Chromium
- Zinc

Additionally, chromium exceeded the SEL.

Vertical delineation of Metals was not accomplished at this location. The concentration of aluminum was within the range of natural background concentrations reported in the NJDEP's *Ambient Levels of Metals in New Jersey Soils* (NJDEP, 2003).

At previous sample location SD-R-L-5-01, four Metals (cadmium, copper, lead, and zinc) exceeded the LEL or SEL standards at a depth of 0.5-1 ft. At vertical delineation sample location SD-R2-L-5-01D, four Metals exceeded the LEL:

- Copper (LEL)
- Lead (LEL and SEL)
- Mercury (LEL)
- Zinc (LEL)

Vertical delineation of cadmium was established at this location. Although the vertical extent of copper, lead and zinc were not delineated at this location, the concentrations of these elements decreased with depth.

At previous sample location SD-R-L-5-02, five Metals (arsenic, cadmium, copper, lead and zinc) exceeding the LEL were detected at a depth of 0.5-1 ft. At vertical delineation sample location SD-R2-L-5-02D, the two Metals listed below exceeded the LEL or SEL:

- Chromium (LEL and SEL)
- Zinc (LEL)

Vertical delineation of arsenic, cadmium, copper, and lead was established at this location. Chromium concentration increased with depth at this location but zinc slightly decreased with depth. Vertical delineation of chromium and zinc was not accomplished at this location.

5.3.3.4 E&E Constituents

A total of five samples were collected and analyzed for E&E constituents to delineate vertical sediment quality during the Phase II RI. The results of these activities are discussed below.

At sample location SD-R2-E-16-1/ SD-R2-E-16-1D no E&E constituents were detected at concentrations exceeding the LEL. Vertical delineation of E&E constituents at this location is complete.

At previous sample location SD-R-M-7-01, no E&E constituents exceeded LEL at a depth of 0.5-1 ft. E&E constituents were inadvertently added to the analyte list for the Phase II RI sediment sample (SD-R2-M-7-01D) collected at this location. The absence of E&E constituents at concentrations exceeding the LEL is consistent with previous results and confirms vertical delineation is complete at this location.

At previous sample location SD-R-L-5-01, two E&E constituents exceeded the LEL at a depth of 0.5-1 ft. At vertical delineation sample location SD-R2-L-5-01D, no E&E constituents were detected at concentrations exceeding the LEL. Vertical delineation of E&E constituents at this location is complete.

At previous sample location SD-R-L-5-02, no E&E constituents exceeded LEL at a depth of 0.5-1 ft. E&E constituents were inadvertently added to the analyte list for the Phase II RI sediment sample (SD-R2-L-5-02D) collected at this location. The absence of E&E constituents at concentrations exceeding the LEL is consistent with previous results and confirms vertical delineation is complete at this location.

5.3.3.5 General Conclusions

Sediment samples were collected from the Facility during the Phase II Sediment RI in an effort to delineate the vertical extent of constituents at concentrations exceeding the LEL at the following five locations:

- SD-R2-E-16-1 (depth 0 to 0.5 ft.)
- SD-R2-E-16-1D (depth 2 to 2.5 ft.)
- SD-R2-M-7-01D (depth 2.5 to 3 ft.) – corresponding to sample location SD-R-M-7-01 of Phase I RI
- SD-R2-L-5-01D (depth 2.5 to 3 ft.) – corresponding to sample location SD-R-L-5-01 of Phase I RI
- SD-R2-L-5-02D (depth 2.5 to 3 ft.) – corresponding to sample location SD-R-L-5-02 of Phase I RI

The following conclusions are provided based on the results of the vertical delineation activities conducted during the Phase II Sediment RI:

- VOCs were either not detected, or detected at concentrations less than the LEL and/or SEL in sediment samples SD-R2-E-16-1 and SD-R2-E-16-1D. No further characterization of VOCs at this location is proposed.

- At sample location SD-R2-E-16-1/ SD-R2-E-16-1D the vertical extent of SVOCs and Metals has not been delineated. However, as this sample location receives runoff from Route 46, the presence of SVOCs and Metals at this location is not believed to be the result of manufacturing activities conducted at the Facility as discussed in Section 5.2. No further action is proposed for this location.

- At sample location SD-R-L-5-02/ SD-R2-L-5-02D, the vertical extent of SVOCs detected at a concentration exceeding the LEL has not been delineated. However, this sample location will be included in the remediation of the old burning grounds (M5-3) and delineation will be completed as part of the remedy.

- The vertical extent of Metals detected at concentrations exceeding the LEL or SEL has not been delineated. Two samples (SD-R-L-5-01/ SD-R2-L-5-01D) are located at the Route 46 culvert where surface water exits the Facility (see Section 5.2). Two samples (SD-R-L-5-01/ SD-R2-L-5-01D) are located in an area that will be included in the remediation of the old burning grounds (M5-3) and delineation will be completed as part of the remedy.

- At sample location (SD-R2-M-7-01D), the vertical extent of Metals has not been delineated. However, the vertical extent of sediment has been established and no further investigation of this area is recommended. At all vertical delineation locations, E&E constituents were either not detected, or detected at concentrations less than the LEL. No further characterization of the vertical distribution of E&E constituents in sediment is proposed.

5.3.4 Facility Wide Evaluation of Sediment Sample Results

This section incorporates the Phase II RI sediment data into the comprehensive site wide sediment characterization dataset for the purposes of fulfilling overall RI objectives in accordance with the TRSR. The overall RI data evaluation employs a site-wide, holistic approach to demonstrate horizontal and vertical delineation of Facility-related influences on sediment quality.

This section compares SI and Phase I RI sediment data to the most recent sediment screening benchmarks. Based on the results of the 586 sediment samples collected during the SI, Phase I RI, and Phase II RI, 4 VOCs, 22 SVOCs, 13 Metals, and 7 E&E constituents were detected at concentrations exceeding their respective LEL and/or SEL.

As indicated on Figure D-3, the extent of sediment with COCs at concentrations exceeding the LEL and SEL have been delineated within the former operational areas of the Facility with the noted exceptions related to offsite

influences at the Facility boundaries discussed in Section 5.2. In certain areas, lateral delineation was achieved relative to the physical boundaries of the aquatic feature (i.e., wetland/upland interface) in lieu of sediment samples with constituent concentrations less than benchmarks. Similarly, the vertical limits of depositional sediment was established using the sediment/glacial till interface (i.e., boring refusal) in lieu of sediment samples with constituent concentrations less than benchmarks.

As discussed in Section 5.2, surface water features draining the former operational area of the Facility merge into a single flowing feature that exits the Facility through a culvert beneath Route 46 in grid E16. There are a series of sediment samples with constituent concentrations less than LEL/SEL benchmarks upgradient of the culvert. In the immediate vicinity of the culvert storm water runoff-related influences (e.g., Metals and PAHs) are found at concentrations exceeding LEL/SEL benchmarks that represent off-site influence as Facility-related influences on sediment quality occur within the former operational areas.

A detailed presentation of the results of the SI and RI for sediment is presented by analytical group in Sections 5.3.1 through 5.3.4.

5.3.4.1 VOCs

The SI and RI collected a total of 146 samples for VOCs. The laboratory analysis of these samples indicated 22 LEL exceedances. SEL have not been established for these constituents. The LEL exceedance rate ranged from 0.7% (chlorobenzene) to 6.2% (methylene chloride). The table below presents a summary of VOC constituents exceeding a benchmark.

SUMMARY OF VOC BENCHMARK EXCEEDANCES

Constituent	LEL	SEL	Number of Exceedances	
			LEL	SEL
Chlorobenzene	0.291	NS	1	0
Chloroform	0.121	NS	7	0
Methylene Chloride	0.159	NS	9	0
Tetrachloroethene	0.45	NS	5	0

Due to relatively small number of VOC detections in sediment samples at the Facility, a single map depicting the combined distribution of VOCs was prepared (Figure D-4). As indicated on Figure D-4 the extent of VOCs in sediment at concentrations exceeding the LEL has been delineated.

Historical VOC sources are believed to be small, single release events (likely attributed to maintenance activities). NJDEP has acknowledged the influence of a regional chlorinated VOC plume on conditions in the southern portion of the Facility.

5.3.4.2 5.3.4.2 SVOCs

The SI and RI collected a total of 341 samples for SVOCs. The laboratory analysis of these samples indicated the LEL exceedance rate ranged from 0.6% (benzo[b]fluoranthene and diethylphthalate) to 22.6% (pyrene) and the SEL exceedance rate ranged from 0% (various constituents) to 14.9% (acenaphthylene). The table below presents a summary of SVOC constituents exceeding a benchmark.

SUMMARY OF SVOC BENCHMARK EXCEEDANCES

Constituent	LEL (mg/kg)	SEL (mg/kg)	Number of Exceedances	
			LEL	SEL

1,4-Dichlorobenzene	0.318	NS	5	0
2-Methylnaphthalene	0.0202	NS	5	0
Acenaphthene	0.00671	0.007-0.02	18	18
Acenaphthylene	0.00587	0.009-0.03	51	51
Anthracene	0.0572	5.4-18.1	24	1
Benzo[a]anthracene	0.108	21.6-72.5	57	1
Benzo[a]pyrene	0.15	21-70.5	51	1
Benzo[b]fluoranthene	10.4	26.2-88.2	2	0
Benzo[g,h,i]perylene	0.17	4.7-14.7	74	1
Benzo[k]fluoranthene	0.24	19.5-65.6	44	1
Bis(2-Ethylhexyl)phthalate	0.182	0.75	15	5
Chrysene	0.166	6.7-22.5	72	2
Dibenzo[a,h]Anthracene	0.33	1.9-6.4	56	1
Diethylphthalate	0.295	NS	2	0
Di-n-butylphthalate	1.114	0.11	6	6
Fluoranthene	0.423	14.9-50	52	1
Fluorene	0.0774	2.3-7.8	11	1
Indeno[1,2,3-cd]pyrene	0.2	4.7-15.7	30	0
Naphthalene	0.176	NS	9	0
Phenanthrene	0.204	13.8-46.50	34	1
Pyrene	0.195	12.4-41.6	77	1

These SVOCs can be separated into three general categories; PAHs, phthalates, and others. Various explosive constituents also appear on the SVOC analyte list, however, they were not detected at concentrations greater than their respective LELs and thus are not discussed further.

Historical sources related to these three categories include: imported historic fill containing PAHs, phthalates used in the production of smokeless gunpowder, and other miscellaneous constituents of unknown origin.

For the PAHs that frequently exceeded a benchmark (acenaphthylene, benzo(a)anthracene, benzo(a)pyrene, benzo[g,h,i]perylene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, fluoranthene, phenanthrene, and pyrene) individual maps depicting the distribution of these SVOCS were prepared. For SVOCs that were detected at concentrations exceeding a benchmark in less than 1% of samples collected (anthracene, acenaphthene, benzo[b]fluoranthene, bis(2-ethylhexyl)phthalate, 1,4-Dichlorobenzene, diethylphthalate, di-n-butylphthalate, fluorene, indeno[1,2,3-cd]pyrene, 2-Methylnaphthalene, and naphthalene), a single map depicting the combined distribution of these SVOCs was prepared.

The following is a description of the SVOCs detected in sediment during the SI/RI:

5.3.4.2.1.1 Pyrene

The SI and RI collected a total of 341 sediment samples analyzed for pyrene. The laboratory analysis of these samples indicated exceedances of the LEL at 77 sample locations (22.6% of samples analyzed) and the exceedance of the SEL at one sample location (0.3% of samples analyzed).

As indicated on Figure D-5 the extent of pyrene in sediment at concentrations exceeding the LEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

5.3.4.2.1.2 Benzo[g,h,i]perylene

The site and remedial investigations collected a total of 341 sediment samples analyzed for benzo[g,h,i]perylene. The analysis of these samples indicated exceedances of the LEL at 74 sample locations (21.7% of samples analyzed) and the exceedance of the SEL at one sample location (0.3% of samples analyzed).

As indicated on Figure D-6 the extent of benzo[g,h,i]perylene in sediment at concentrations exceeding the LEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

5.3.4.2.1.3 Chrysene

A total of 341 sediment samples were collected and analyzed for chrysene during the site and remedial investigations at the Facility. The laboratory analysis of these samples indicated exceedances of the LEL at 72 sample locations (21.1% of samples analyzed) and the exceedance of the SEL at 2 locations (0.6% of samples analyzed).

Figure D-7 indicates the extent of chrysene in sediment at concentrations exceeding either the LEL or SEL and demonstrates delineation within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

5.3.4.2.1.4 Benzo[a]anthracene

The site and remedial investigations collected a total of 341 sediment samples analyzed for benzo[a]anthracene. The analysis of these samples indicated exceedances of the LEL at 57 sample locations (16.7% of samples analyzed) and the exceedance of the SEL at one sample location (0.3% of samples analyzed).

As indicated in Figure D-8 the extent of benzo[a]anthracene in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

5.3.4.2.1.5 Dibenzo[a,h]Anthracene

The site and remedial investigations collected a total of 341 sediment samples analyzed for dibenzo[a,h]anthracene. The laboratory analysis of the samples indicated exceedances of the LEL at 56 sample locations (16.4% of samples analyzed) and the exceedance of the SEL at one sample location (0.3% of samples analyzed).

As indicated in Figure D-9 the lateral extent of dibenzo[a,h]anthracene in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2. In the northwest corner of Duck Pond the vertical extent of this constituent in sediment has not been delineated. However, delineation of constituent concentrations in sediment in this area of the Facility will be addressed as part of the remedy for the old burning grounds and associated influences on adjacent Duck Pond sediment. (see Section 5.3.3).

5.3.4.2.1.6 Fluoranthene

A total of 341 sediment samples were collected and analyzed for fluoranthene during the site and remedial investigations at the Facility. The laboratory analysis of these samples indicated exceedances of the LEL at 52

sample locations (15.2% of samples analyzed) and the exceedance of the SEL at one location SEL at one sample location (0.3% of samples analyzed).

As indicated in Figure D-10 the extent of fluoranthene in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

*5.3.4.2.1.7 **Acenaphthylene***

The site and remedial investigations collected a total of 341 sediment samples analyzed for acenaphthylene. The analysis of these samples indicated exceedances of the LEL and SEL at 51 sample locations (15% LEL/of samples analyzed).

As indicated in Figure D-11 the extent of acenaphthylene in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

*5.3.4.2.1.8 **Benzo[a]pyrene***

The site and remedial investigations collected a total of 341 sediment samples analyzed for benzo[a]pyrene. The laboratory analysis of these samples indicated exceedances of the LEL at 51 sample locations (15% of samples analyzed) and the exceedance of the SEL at one sample location (0.3% of samples analyzed).

Figure D-12 indicates the lateral extent of benzo[a]pyrene in sediment at concentrations exceeding either the LEL (15% of samples analyzed) or SEL and demonstrates delineation within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2. In the northwest corner of Duck Pond the vertical extent of this constituent in sediment has not been delineated. However, delineation of constituent concentrations in sediment in this area of the Facility will be addressed as part of the remedy for the old burning grounds and associated influences on adjacent Duck Pond sediment. (see Section 5.3.3).

*5.3.4.2.1.9 **Benzo[k]fluoranthene***

The site and remedial investigations collected a total of 341 sediment samples analyzed for benzo[k]fluoranthene. The laboratory analysis of these samples indicated exceedances of the LEL at 44 sample locations (12.9% of samples analyzed) and the exceedance of the SEL at one sample location (0.3% of samples analyzed).

Figure D-13 indicates the extent of benzo[k]fluoranthene in sediment at concentrations exceeding either the LEL or SEL and demonstrates delineation within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

*5.3.4.2.1.10 **Phenanthrene***

The site and remedial investigations collected a total of 341 sediment samples analyzed for phenanthrene. The laboratory analysis of these samples indicated exceedances of the LEL at 34 sample locations (10% of samples analyzed) and the exceedance of the SEL at one sample location (0.3% of samples analyzed).

Figure D-14 indicates that the extent of phenanthrene in sediment at concentrations exceeding either the LEL or SEL and demonstrates delineation within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

*5.3.4.2.1.11 **Remaining SVOCs***

For the remaining 11 SVOCs that were detected at concentrations exceeding a screening benchmark in less than 10% of samples (1,4-Dichlorobenzene, 2-Methylnaphthalene, acenaphthene, anthracene, benzo[b]fluoranthene, bis(2-ethylhexyl)phthalate, diethylphthalate, di-n-butylphthalate, fluorene, indeno[1,2,3-cd]pyrene, and naphthalene), a single map depicting the combined distribution of these SVOCs was prepared. For the remaining SVOCs, the number of samples analyzed ranged from 0.6% (benzo[b]fluoranthene and diethylphthalate) to 7% (anthracene) and the number of samples analyzed ranged from 0% (benzo[b]fluoranthene and indeno[1,2,3-cd]pyrene) to 5.3% (acenaphthene). SELs have not been developed for the following SVOCs:

- 1,4-Dichlorobenzene
- 2-Methylnaphthalene
- Diethylphthalate
- Naphthalene

SUMMARY OF BENCHMARK EXCEEDANCES FOR REMAINING SVOCS

Constituent	LEL (mg/kg)	SEL (mg/kg)	Number of Exceedances		Exceedance Rate (%)	
			LEL	SEL	LEL	SEL
1,4-Dichlorobenzene	0.318	NS	5	NA	1.5	NA
2-Methylnaphthalene	0.0202	NS	5	NA	1.5	NA
Acenaphthene	0.00671	0.007-0.02	18	18	5.3	5.3
Anthracene	0.0572	5.4-18.1	24	1	7.0	0.3
Benzo[b]fluoranthene	10.4	26.2-88.2	2	0	0.6	0.0
Bis(2-Ethylhexyl)phthalate	0.182	0.75	15	5	4.4	1.5
Diethylphthalate	0.295	NS	2	NA	0.6	NA
Di-n-butylphthalate	1.114	0.11	6	6	1.8	1.8
Fluorene	0.0774	2.3-7.8	11	1	3.2	0.3
Indeno[1,2,3-cd]pyrene	0.2	4.7-15.7	30	0	8.8	0.0
Naphthalene	0.176	NS	9	NA	2.6	NA

As indicated on Figure D-15 the extent of the remaining SVOCs in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

5.3.4.3 Metals

Metals detected at concentrations exceeding either LEL or SEL at the Facility are primarily associated with the historically common practice of using fly ash, bottom ash, and slag as fill material (historic fill) to improve the grade of the Facility, recover unusable land, and establish numerous narrow gauge rail beds. Streams and drainage ditches transect historic fill material and erosion of the fill material and deposition in the beds of the streams and drainage ditches occurs. Additionally, surface water drainage that flows into the streams, drainage ditches and ponds often comes in contact with historic fill before entering the surface water body. This surface flow has the ability to carry historic fill constituents into the surface water bodies. To a lesser extent, these constituents are associated with historic manufacturing processes when found outside the area of historic fill or where concentrations exceed the typical concentration for historic fill. In addition, Metals occur naturally at varying concentrations in the earth's crust. The Soils SI evaluated local and regional background Metals concentrations and established a site-specific background value for mercury and a regional background value for beryllium.

The SI and RI collected a total of 589 samples for Metals. The laboratory analysis of these samples indicated the

LEL exceedance rate ranged from 2.8% (cobalt) to 57.9% (lead) and the SEL exceedance rate ranged from 0.3% (cadmium) to 17.1% (lead). The table below presents a summary of Metals exceeding a benchmark.

SUMMARY OF METALS BENCHMARK EXCEEDANCES

Constituent	LEL (mg/kg)	SEL (mg/kg)	Number of Exceedances	
			LEL	SEL
Aluminum	0.0255	NS	7	NA
Antimony	NS	5	NA	5
Arsenic	6	33	188	5
Cadmium	0.6	10	159	2
Chromium	26	110	80	7
Cobalt	50	NS	1	NA
Copper	16	110	331	28
Lead	31	250	341	101
Manganese	630	1,100	4	3
Mercury	0.2	2	230	34
Nickel	16	75	63	5
Silver	1	NS	24	NA
Zinc	120	820	201	8

For the Metals that frequently exceeded a benchmark (aluminum, antimony, arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver, and zinc) individual maps depicting the distribution of these Metals were prepared. For Metals that were detected at concentrations exceeding a benchmark in less than 1% of samples collected (cobalt and manganese), a single map depicting the combined distribution of these Metals was prepared. The following is a description of the Metals detected in sediment during the SI/RI:

*5.3.4.3.1.1 **Arsenic***

The site and remedial investigation collected a total of 589 sediment samples analyzed for arsenic. The laboratory analysis of these samples indicated exceedances of the LEL at 188 sample locations (31.9% of samples analyzed) and the exceedance of the SEL at five sample locations (0.8% of samples analyzed).

As indicated in Figure D-16 the extent of arsenic in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

*5.3.4.3.1.2 **Copper***

A total of 589 sediment samples were collected and analyzed for copper during the site and remedial investigations at the Facility. The analysis of these samples indicated exceedances of the LEL at 331 sample locations (56.2% of samples analyzed) and the exceedance of the SEL at 28 sample locations (4.8% of samples analyzed).

As indicated on Figure D-17 the lateral extent of copper in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2. In the northwest corner of Duck Pond the vertical extent of this constituent in sediment has not been delineated. However, delineation of constituent concentrations in sediment in this area of the Facility will be addressed as part of the remedy for the old burning

grounds and associated influences on adjacent Duck Pond sediment. (see Section 5.3.3).

*5.3.4.3.1.3 **Lead***

The site and remedial investigations collected a total of 589 sediment samples analyzed for lead. The laboratory analysis of these samples indicated exceedances of the LEL at 341 sample locations (57.9% of samples analyzed) and the exceedance of the SEL at 101 sample locations (17.1% of samples analyzed).

As indicated on Figure D-18 the lateral extent of lead in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2. In the northwest corner of Duck Pond the vertical extent of this constituent in sediment has not been delineated. However, delineation of constituent concentrations in sediment in this area of the Facility will be addressed as part of the remedy for the old burning grounds and associated influences on adjacent Duck Pond sediment. (see Section 5.3.3).

*5.3.4.3.1.4 **Mercury***

The site and remedial investigations collected a total of 589 sediment samples analyzed for mercury. The laboratory analysis of these samples indicated exceedances of the LEL at 230 sample locations (39% of samples analyzed) and the exceedance of the SEL at 34 sample locations (5.8% of samples analyzed).

As indicated on Figure D-19 the lateral extent of mercury in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2. In the northwest corner of Duck Pond the vertical extent of this constituent in sediment has not been delineated. However, delineation of constituent concentrations in sediment in this area of the Facility will be addressed as part of the remedy for the old burning grounds and associated influences on adjacent Duck Pond sediment. (see Section 5.3.3).

5.3.4.3.1.5 ***Zinc***

The site and remedial investigations collected a total of 589 sediment samples analyzed for zinc. The laboratory analysis of these samples indicated exceedances of the LEL at 201 sample locations (34.1% of samples analyzed) and the exceedance of the SEL at 8 sample locations (51.4% of samples analyzed).

As indicated on Figure D-20 the lateral extent of zinc in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2. In the northwest corner of Duck Pond the vertical extent of this constituent in sediment has not been delineated. However, delineation of constituent concentrations in sediment in this area of the Facility will be addressed as part of the remedy for the old burning grounds and associated influences on adjacent Duck Pond sediment. (see Section 5.3.3).

5.3.4.3.1.6 ***Cadmium***

The site and remedial investigations collected a total of 589 sediment samples analyzed for cadmium. The laboratory analysis of these samples indicated exceedances of the LEL at 159 sample locations (27% of samples analyzed) and the exceedance of the SEL at two sample locations (0.3% of samples analyzed).

As indicated on Figure D-21 the extent of cadmium in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

5.3.4.3.1.7 ***Chromium***

The site and remedial investigations collected a total of 589 sediment samples analyzed for chromium. The laboratory analysis of these samples indicated exceedances of the LEL at 80 sample locations (13.6% of samples analyzed) and the exceedance of the SEL at seven sample locations (1.2% of samples analyzed).

As indicated on Figure D-22 the lateral extent of chromium in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2. In the northwest corner of Duck Pond the vertical extent of this constituent in sediment has not been delineated. However, delineation of constituent concentrations in sediment in this area of the Facility will be addressed as part of the remedy for the old burning grounds and associated influences on adjacent Duck Pond sediment. (see Section 5.3.3).

5.3.4.3.1.8 ***Nickel***

The site and remedial investigations collected a total of 589 sediment samples analyzed for nickel. The laboratory analysis of these samples indicated exceedances of the LEL at 63 sample locations (10.7% of samples analyzed) and the exceedance of the SEL at five sample locations (0.8% of samples analyzed).

As indicated on Figure D-23 the extent of nickel in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

*5.3.4.3.1.9 **Aluminum***

The site and remedial investigations collected a total of 36 sediment samples analyzed for aluminum (5.6% of samples analyzed). The laboratory analysis of these samples indicated exceedances of the LEL at 2 sample locations. There is no SEL for aluminum.

As indicated on Figure D-24 the extent of aluminum in sediment at concentrations exceeding either the LEL has been delineated within the former operational areas of the Facility.

*5.3.4.3.1.10 **Silver***

The site and remedial investigations collected a total of 589 sediment samples analyzed for silver. The laboratory analysis of these samples indicated exceedances of the LEL at 24 sample locations (4.1% of samples analyzed). There were no exceedances of the SEL.

As indicated on Figure D-25 the extent of silver in sediment at concentrations exceeding either the LEL has been delineated within the former operational areas of the Facility, with the noted exceptions related to offsite influences at the Facility boundaries discussed in Section 5.2.

*5.3.4.3.1.11 **Antimony***

The site and remedial investigations collected a total of 179 sediment samples analyzed for antimony. The laboratory analysis of these samples indicated exceedances of the SEL at five sample locations (2.8% of samples analyzed). A LEL has not been established for this constituent.

As indicated on Figure D-26 the extent of antimony in sediment at concentrations exceeding SEL has been delineated within the former operational areas of the Facility.

*5.3.4.3.1.12 **Remaining Metals***

As there were few detections of manganese (5) and cobalt (1) at concentrations exceeding a benchmark, a single map depicting the combined distribution of these Metals was prepared. The laboratory analyses of these samples indicated total exceedances of LELs at 5 sample locations and the exceedance of the SELs at 3 locations. For the remaining Metals, the LEL exceedance rate ranged from 2.8% (cobalt) to 11.1% (manganese). Manganese has an SEL exceedance rate of 8.3%. A SEL has not been developed for cobalt.

SUMMARY OF BENCHMARK EXCEEDANCES FOR REMAINING METALS

Constituent	LEL (mg/kg)	SEL (mg/kg)	Number of Exceedances		Exceedance Rate (%)	
			LEL	SEL	LEL	SEL
Manganese	630	1100	4	3	11.1	8.3
Cobalt	50	NS	1	NA	2.8	NA

As indicated on Figure D-27 the extent of remaining Metals in sediment at concentrations exceeding either the LEL or SEL has been delineated within the former operational areas of the Facility.

E&E

The SI and RI collected a total of 516 samples for E&E constituents. The laboratory analysis of these samples indicated the LEL exceedance rate ranged from 0.2% (1,3,5-trinitrobenzene and HMX) to 4.5% (2,4-Dinitrotoluene) and the SEL exceedance rate ranged from 0% (HMX) to 0.2% (1,3,5-trinitrobenzene). Please note two E&E constituents (2,4-dinitrotoluene and nitrobenzene) were analyzed using both Methods 8330 and 8270C. The 8270 data was utilized for these constituents as they are more precise. 2,4-dinitrotoluene and nitrobenzene are discussed in the E&E compound section due to their close relation to E&E manufacturing. The table below presents a summary of E&E constituents exceeding a benchmark.

SUMMARY OF E&E BENCHMARK EXCEEDANCES

Constituent	LEL (µg/kg)	SEL (µg/kg)	Number of Exceedances	
			LEL	SEL
1,3,5-TRINITROBENZENE	2.33-7.84	12.4-41.6	1	1
2,4,6-TRINITROTOLUENE	92	NS	18	NA
2,4-Dinitrotoluene	14.4	NS	14	NA
2,6-Dinitrotoluene	39.8	NS	5	NA
Nitrobenzene	145	NS	11	NA
RDX	13	NS	2	NA
HMX	5.54-18.6	625-2101	1	0

For the E&E constituents that frequently exceeded a benchmark (2,4,6-trinitrotoluene, 2,4-dinitrotoluene, nitrobenzene) individual maps depicting the distribution of these Metals were prepared. For E&E constituents that were detected at concentrations exceeding a benchmark in less than 2% of samples collected (1,3,5-trinitrobenzene, 2,6-dinitrotoluene, HMX, and RDX), a single map depicting the combined distribution of these E&E constituents was prepared. The following is a description of the E&E constituents detected in sediment during the SI/RI investigations:

5.3.4.3.1.13 ***2,4,6-Trinitrotoluene***

The site and remedial investigations collected a total of 516 sediment samples analyzed for 2,4,6-trinitrotoluene. The laboratory analysis of these samples indicated exceedances of the LEL at 18 sample locations (3.5% of samples analyzed). A SEL has not been established for this constituent.

As indicated on Figure D-28 the extent of 2,4,6-trinitrotoluene in sediment at concentrations exceeding the LEL has been delineated within the former operational areas of the Facility. The distribution of TNT is limited to the Western and Central Drainage Areas, down gradient of the TNT and Dynamite Areas.

5.3.4.3.1.14 ***2,4-Dinitrotoluene***

The site and remedial investigations collected a total of 308 sediment samples analyzed for 2,4-dinitrotoluene. The laboratory analysis of these samples indicated exceedances of the LEL at 14 sample locations (3.5% of samples analyzed). A SEL has not been established for this constituent.

As indicated on Figure D-29 the extent of 2,4-dinitrotoluene in sediment at concentrations exceeding the LEL has been delineated within the former operational areas of the Facility.

5.3.4.3.1.15 ***Nitrobenzene***

The site and remedial investigations collected a total of 515 sediment samples analyzed for nitrobenzene (2.1% of samples analyzed). The laboratory analysis of these samples indicated exceedances of the LEL at 11 sample locations. A SEL has not been established for this constituent.

As indicated on Figure D-30 the extent of nitrobenzene in sediment at concentrations exceeding the LEL has been delineated within the former operational areas of the Facility.

5.3.4.3.1.16 ***Remaining E&E Constituents***

For the remaining four E&E constituents that were detected at concentrations exceeding a benchmark in less than 2% of samples (1,3,5-trinitrobenzene, 2,6-dinitrotoluene, HMX, and RDX), a single map depicting the combined distribution of these E&E constituents was prepared. For the remaining E&E constituents, the of samples analyzed ranged from 0.2% (1,3,5-Trinitrobenzene and HMX) to 1.5% (2,6-Dinitrotoluene) and the of samples analyzed ranged from 0% (HMX) to 0.2% (1,3,5-trinitrobenzene) SELs have not been developed for 2,6-Dinitrotoluene and RDX.

SUMMARY OF BENCHMARK EXCEEDANCES FOR REMAINING Metals

Constituent	LEL (mg/kg)	SEL (mg/kg)	Number of Exceedances		Exceedance Rate (%)	
			LEL	SEL	LEL	SEL
1,3,5-Trinitrobenzene	2.33-7.84	12.4-41.6	1	1	0.2	0.2
2,6-Dinitrotoluene	39.8	NS	5	NA	1.5	NA
RDX	13	NS	2	NA	0.4	NA
HMX	5.54-18.6	625-2101	1	0	0.2	0.0

As indicated on Figure D-31 the extent of the remaining E&E constituents in sediment at concentrations exceeding the LEL have been delineated within the former operational areas of the Facility.

6 CONCLUSIONS

6.1 PHASE II SEDIMENT RI FINDINGS

As presented in Section 2.2, Phase II RI sediment sampling focused on the following:

- Evaluating sediment quality outside of defined channels within wetland areas
- Evaluating surface water/sediment interactions
- Confirming the depth of constituents at concentrations above applicable standards at select locations
- Further characterization of the extent of Facility-related influences in the interior of the Facility (former operational areas)

A total of 26 sediment samples were collected and analyzed in support of these objectives. The required sample frequencies, analytical suites, and quality assurance/quality control samples presented in the Phase II RI Memorandum (OBG, 2013) were met for sediment samples collected during the Phase II RI field sampling, with the exception of one proposed sample that was not collected because it was located within an upland area (discussed in Section 2.2). A review of the laboratory analytical data indicated that the data are acceptable and of a quality appropriate for evaluating site conditions and subsequent actions.

The following subsections summarize the investigation findings relative to the Phase II RI objectives.

6.2 SPECIFIC PHASE II SEDIMENT RI FINDINGS

6.2.1 Evaluation of Sediment Quality Outside Stream Channels

The evaluation of sediment quality outside of stream channels indicated exceedances of the LEL or SEL in all 20 sediment samples collected from outside of defined stream channels. However, further analysis of the results indicates three separate sources for the presence of constituents in sediment at concentrations exceeding the LEL/SEL. These sources include historic fill, Facility operations, and offsite influences and are further evaluated below.

- Of these 20 locations, 16 samples were located in or adjacent to historic fill material, adjacent to stream channels that were down gradient of historic fill, or in the interior portions of the Facility in wetland areas that received runoff from areas where historic fill was emplaced. This illustrates the wide ranging effect the presence of historic fill has on sediment quality.

- Former Facility operations effected sediment quality outside of defined stream channels at two locations in Experimental Dynamite Area, which is located in the Development Area.

- At two locations (Route 46 (SD-R2-E-16-3) and the NJ transit line (SD-R2-O-4-1)), the presence of PAHs and Metals, in sediment samples at concentrations exceeding the LEL/SEL is attributed to off-site influences. The absence of Facility related constituents at these locations further supports an offsite source for the PAHs and Metals.

6.2.2 Relationship between Surface Water and Sediment

The evaluation of the relationship between surface water quality and sediment quality conducted as part of the Phase II Sediment RI indicated the following:

- SVOCs were detected in sediment, but not in surface water at five of the seven co-located sample points. At two of the seven co-located sample points SVOCs were detected in surface water at concentrations four orders of magnitude lower than the concentrations in the sediment sample, indicating minimal partitioning of SVOCs from sediment to surface water.

- Beryllium, selenium, and silver were detected in sediment and not in surface water, indicating these constituents are not partitioning from sediment to surface water.

- Arsenic, cadmium, chromium, cobalt, copper, lead, mercury, nickel, vanadium, and zinc were detected in surface water and sediment. However, the concentrations of the Metals detected in sediment were typically three to five orders of magnitude higher than in sediment than in surface water, indicating minimal partitioning of Metals from sediment to surface water.

- Aluminum, barium, calcium, iron, magnesium, potassium, and manganese were detected in both surface water and sediment samples from each co-location. As indicated in *Elemental Concentrations in Soil and Other Surficial Materials of the Counterminous United States*, USGS Professional Paper 720, 1984 (USGS, 1984), these Metals are commonly found in surficial geologic materials in the vicinity of the Facility.

- E&E constituents were not detected in sediment samples collected from the seven co-located sample points. As such, no conclusions related to the effect E&E constituents present in sediment have on surface water could be made.

6.2.3 Evaluation of Vertical Delineation Results

The evaluation of the vertical delineation results conducted as part of the Phase II Sediment RI indicated the following:

- At two of the four locations (SD-R2-E-16-1D and SD-R2-M-7-01D) the vertical extent of sediment has been established but LEL exceedances were identified at the base of the sediment layer. No further investigations are proposed for these areas. Furthermore, at one of these locations (SD-R2-E-16-1D) the presence of constituents at concentrations exceeding a benchmark is attributed to off-site influence (See Section 5.2).

- At two locations (SD-R2-L-5-01D and SD-R2-L-5-02D) in the northwest corner of Duck Pond, the vertical extent of this constituents in sediment exceeding a benchmark has not been delineated. However, delineation of constituent concentrations in sediment in this area of the Facility will be addressed as part of the remedy for the Old Burning grounds and associated influences on adjacent Duck Pond sediment. (see Section 5.3.3).

6.3 OVERALL RI FINDINGS – SEDIMENT

Data collected during Phase II RI field sampling activities were incorporated into the site characterization dataset (SI, Phase I RI and Phase II RI data). The following subsections summarize the evaluation of the dataset in the context of the overall remedial investigation objectives.

6.3.1 Site Characterization

The SI, Phase I RI and Phase II RI sediment samples identified 4 VOCs, 22 SVOCs, 13 Metals, and 7 E&E Constituents, at concentrations exceeding one or more comparison criteria (i.e., LEL and SEL). Sediment sampling results are summarized below.

- VOCs detected at concentrations exceeding the LEL or SEL have been delineated.

- The extent of soils with SVOCs at concentrations exceeding the LEL or SEL has been delineated within the former operational areas of the facility. However, SVOCs were detected at various locations along the perimeter of the Facility, in areas beyond the influence of Facility operations and/or in close proximity to transportation routes (roadways, parking lots), are believed to represent off-site influences.

- Metals, with the exception of lead, arsenic, cadmium, chromium, copper, nickel, and zinc, have not been delineated at the property boundary. However, the extent of sediment with lead, arsenic, cadmium, chromium, copper, nickel, and zinc at concentrations exceeding comparison criteria has been delineated within the former operational areas of the Facility. Metals that were detected at various locations along the perimeter of the Facility, in areas beyond the influence of Facility operations and/or in close proximity to transportation routes (roadways, parking lots), are believed to represent off-site influences.

- E&E constituents detected at concentrations exceeding the LEL have been delineated.

The information in this Phase II Sediment RIR defines the extent of Facility-related influences on sediment quality relative to applicable screening benchmarks. Screening benchmarks are values below which no adverse ecological effects are expected. Exceeding these benchmarks indicates the potential for an effect. The potential for effects is evaluated in the Ecological Evaluation/Ecological Risk Assessment (Volume F), and the resulting scientifically-based risk management decisions will identify areas requiring remedial action and support remedy selection and design.

6.3.2 Historic Fill

RI data and a historic fill investigation indicate that historic fill is widespread with an areal extent estimated to be 161 acres. Sediment samples collected within areas of known historic fill, in wetland areas adjacent to historic fill, and in stream channels that traverse through or are down gradient of historic fill commonly have SVOCs and Metals at concentrations exceeding the LEL and/or SEL. The detected constituents and concentrations are similar to those previously listed in Table 4-2 (Summary of Target Contaminant Concentrations in Typical Historic Fill Material) of the TRSR.

6.3.3 Extent of COCs

Historical development and manufacturing practices, process upsets, decontamination activities, and runoff associated with precipitation events introduced manufacturing products and byproducts into sediments present in the wetlands, stream channels, and ponds at the Facility. These constituents (i.e., VOCs, SVOCs, Metals, E&E constituents, and PCBs) remain present at concentrations greater than LEL and SEL. Given the means by which these constituents were introduced to Facility sediment and the physiochemical properties (e.g., hydrophobicity, affinity for binding to organic carbon), they remain contained within the Facility and occur primarily within the former operational areas.

As identified in Section 5.2 there are several surface water bodies and wetland areas on the perimeter of the Facility where COCs were detected at concentrations exceeding one or more comparison criterion. As no manufacturing, storage or maintenance actives were conducted in these areas, the presence of COCs in sediment in these areas is likely attributed to either runoff from adjacent roadways or rail lines. Segregation of these isolated areas from Facility-related influences observed in the former process areas, coupled with the constituents associated with historical manufacturing operations in these areas further supports the influence of anthropogenic sources unrelated to the Facility.

6.4 RECOMMENDATIONS

Based on the Results of the Sediment RI, the following activities will be conducted by Hercules as part of the remedial action for sediment:

- Facility-related influences on sediment quality occurred as acute releases during manufacturing operations (i.e., spills) and chronic, ongoing erosion from adjacent upland areas (i.e., burning grounds, banks composed of historic fill). Release and transport mechanisms are discussed in greater detail in the conceptual site model presented in the Phase II RIR Summary (Volume A). The Ecological Evaluation/Ecological Risk Assessment (Volume F) acknowledges that remedial action is necessary in certain areas of the Facility, prioritizes these areas based on complexity and severity, and outlines presumptive remedies associated with each area. The areas addressed in the EE/ERA include areas influencing sediment quality (i.e., old burning ground [M5-3], TNT Area). Hercules is committed to addressing these areas, and other areas identified via ongoing risk assessment activities. Comprehensive remedies addressing both upland source areas and related sediment influences will be developed to address protection of both human health and environment.
- Maintain existing weirs and ensure proper future function of the weirs

Notes:
VOCS = Volatile organic compounds
SVOCS = Semi-volatile organic compounds
E&E = Explosive and energetic compounds
FWC-LEL= Fresh Water Criteria - Lowest Effe
FWC-SEL= Fresh Water Criteria - Severe Effec
NA = Not analyzed ; NS = No standard
^ Site Speific Screening Level = Criteria were p
U = Indicates that the constituent was analyzed f
J = Indicates that the constituent was analyzed fo
and/or number indicates an estimated value
B = Indicates that the constituent was found in th
concentrations greater than the FWC-LEL
Shade = Indicates that the constituent was detec
greater than the FWC-SEL

LEGEND

- SI SEDIMENT SAMPLE LOCATION
- RI PHASE I SEDIMENT SAMPLE LOCATION
- RI PHASE II SEDIMENT SAMPLE LOCATION (O'BRIEN & GERE, DEC. 2013)
- FORMER SEDIMENT SAMPLE LOCATION THAT IS CURRENTLY CONSIDERED A SOIL SAMPLE LOCATION (NOTE 7)
- PROPOSED RI SEDIMENT SAMPLE THAT WAS NOT COLLECTED
- EASTERN DRAINAGE AREA
- CENTRAL DRAINAGE AREA
- WESTERN DRAINAGE AREA
- DUCK POND AND TRIBUTARIES DRAINAGE AREA
- MISCELLANEOUS PONDS
- SURFACE WATER FLOW DIRECTION
- DRY STREAM SEGMENT, AREA, OR FORMER DITCH (SEE NOTE 5)
- STREAM SEGMENT OR AREA WITHOUT SUFFICIENT WATER PRESENT (SEE NOTE 6)
- HISTORIC FILL
- PROPERTY LINE
- FORMER OPERATIONAL AREA
- WATER FEATURE
- WET AREA (NOTE 8)
- PERIMETER OF WET AREA (NOTE 8)
- STREAMS
- CULVERT
- FENCE
- GUIDE RAIL
- RAILROAD
- SMALL GAUGE RAIL
- TRAIL/DIRT ROAD
- ELECTRIC SUBSTATION
- BUILDING

NOTES:
1. THESE FILES ARE IN THE NORTH AMERICAN DATUM 1983 NEW JERSEY STATE PLANE COORDINATE SYSTEM. THE TOPOGRAPHIC FILE REFERENCES THE NORTH AMERICAN VERTICAL DATUM 1988. THE FACILITY GRID SYSTEM WAS HISTORICALLY DEVELOPED BY HERCULES INCORPORATED TO AID SITE MANAGEMENT, AND THE GRID LINES ARE NOT ORIENTED TO TRUE NORTH.
2. THE BOUNDARY LINE AS DELINEATED IS APPROXIMATE AND HAS BEEN DIGITIZED FROM A MAP ENTITLED "HERCULES INCORPORATED, KENVIL PLANT PROPERTY MAP, PLANT 080, ACCOUNT 9500, CLASSIFICATION 21045, FILE CODE 5WE REVISION 1" REVISED TO JUNE 11, 1970 PROVIDED BY REPRESENTATIVES OF HERCULES, INC., AND THE TAX MAP OF THE TOWNSHIP OF ROXBURY AND NOT FROM AN ACTUAL FIELD SURVEY OR WITH THE BENEFIT OF A TITLE SEARCH.
3. SEDIMENT REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SURFACE WATER/SEDIMENT SITE INVESTIGATION (SW/SD-SI) REPORT (MWH, 2004) AND THE SEDIMENT RI REPORT (MWH, 2006).
4. PHASE 2 SEDIMENT REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SEDIMENT REMEDIAL INVESTIGATION REPORT (MWH, 2006)
5. SOLID BROWN LINES REPRESENT DRY STREAM SEGMENTS OR FORMER DITCHES THAT NO LONGER CONVEY WATER SINCE MANUFACTURING OPERATIONS HAVE CEASED. THESE AREAS ARE NO LONGER CONSIDERED SURFACE WATER OR SEDIMENT BODIES AND ARE CONSIDERED SOIL IN THE REMEDIAL INVESTIGATION REPORT.
6. DASHED BROWN LINES REPRESENT STREAM SEGMENTS OR AREAS WITHOUT SUFFICIENT WATER PRESENT FOR SURFACE WATER SAMPLE COLLECTION, HOWEVER SATURATED SEDIMENTS ARE PRESENT.
7. SITE INVESTIGATION SEDIMENT SAMPLE LOCATIONS DENOTED IN PURPLE ARE INCLUDED IN VOLUME B - SOIL REMEDIAL INVESTIGATION. THESE SAMPLES ARE NO LONGER CONSIDERED AS SEDIMENTS (MWH, 2006) AND ARE MORE PROPERLY DEFINED AS SOILS.
8. THIS PLAN IS ADAPTED FROM FIGURES AS PRESENTED IN THE SEDIMENT REMEDIAL INVESTIGATION REPORT (MWH, 2006).
9. PERIMETER OF WET AREAS ADAPTED FROM A FACILITY-WIDE WETLAND ASSESSMENT CONDUCTED MAY THROUGH JULY 2011 BY ARCADIS. THESE BOUNDARIES HAVE NOT BEEN FIELD VERIFIED AND/OR APPROVED BY NJDEP - DIVISION OF LAND USE REGULATION VIA A LETTER INTERPRETATION.

TRUE NORTH

IT IS A VIOLATION OF LAW FOR ANY PERSON, UNLESS ACTING UNDER THE DIRECTION OF A LICENSED ENGINEER, TO ALTER THIS DOCUMENT.

THIS DRAWING WAS PREPARED AT THE SCALE INDICATED. INACCURACIES IN THE STATED SCALE MAY BE INTRODUCED WHEN DRAWINGS ARE REPRODUCED BY ANY MEANS. USE THE GRAPHIC SCALE BAR TO DETERMINE THE ACTUAL SCALE.

NOTES:
All sample depths (0-0) refer to feet below ground surface
SVOCS = Semi-volatile organic compounds
E&E = Explosive and energetic compounds
LEL = Lowest Effects Level
SEL = Severe Effects Level
NE = No Exceedance
NS = No standard
NA = Not Analyzed
J = Indicates that the constituent was analyzed for and was detected below the reporting limit, and/or number indicates an estimated value
Double Underline = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the LEL
Shade = Indicates that the constituent was detected by laboratory analysis at concentrations greater than the SEL

NOTES:
1. THESE FILES ARE IN THE NORTH AMERICAN DATUM 1983 NEW JERSEY STATE PLANE COORDINATE SYSTEM. THE TOPOGRAPHIC FILE REFERENCES THE NORTH AMERICAN VERTICAL DATUM 1988. THE FACILITY GRID SYSTEM WAS HISTORICALLY DEVELOPED BY HERCULES INCORPORATED TO AID SITE MANAGEMENT, AND THE GRID LINES ARE NOT ORIENTED TO TRUE NORTH.
2. THE BOUNDARY LINE AS DELINEATED IS APPROXIMATE AND HAS BEEN DIGITIZED FROM A MAP ENTITLED "HERCULES INCORPORATED, KENVIL PLANT PROPERTY MAP, PLANT 080, ACCOUNT 9500, CLASSIFICATION 21045, FILE CODE 5WE REVISION 1" REVISED TO JUNE 11, 1970 PROVIDED BY REPRESENTATIVES OF HERCULES, INC., AND THE TAX MAP OF THE TOWNSHIP OF ROXBURY AND NOT FROM AN ACTUAL FIELD SURVEY OR WITH THE BENEFIT OF A TITLE SEARCH.
3. SEDIMENT REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SURFACE WATER/SEDIMENT SITE INVESTIGATION (SWISD-SI) REPORT (MWH, 2004).
4. PHASE 2 SEDIMENT REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SEDIMENT REMEDIAL INVESTIGATION REPORT (MWH, 2006)
5. SEDIMENT ANALYTICAL SAMPLE RESULTS WERE COMPARED TO CRITERIA DERIVED FROM THE FOLLOWING APPLICABLE SEDIMENT BENCHMARKS: NJDEP FRESHWATER SEDIMENT SCREENING GUIDELINES (FSSG) LOWEST EFFECTS LEVEL (LEL) AND SEVERE EFFECTS LEVEL (SEL), 1998; OAK RIDGE NATIONAL LABORATORY RISK ASSESSMENT INFORMATION SYSTEM (RAIS); ECOLOGICAL RISK ASSESSMENT FRESHWATER SEDIMENT SCREENING BENCHMARKS (SSB).
6. SOLID BROWN LINES REPRESENT DRY STREAM SEGMENTS OR FORMER DITCHES THAT NO LONGER CONVEY WATER SINCE MANUFACTURING OPERATIONS HAVE CEASED. THESE AREAS ARE NO LONGER CONSIDERED SURFACE WATER OR SEDIMENT BODIES AND ARE CONSIDERED SOIL IN THE REMEDIAL INVESTIGATION REPORT.
7. DASHED BROWN LINES REPRESENT STREAM SEGMENTS OR AREAS WITHOUT SUFFICIENT WATER PRESENT FOR SURFACE WATER SAMPLE COLLECTION, HOWEVER SATURATED SEDIMENTS ARE PRESENT.
8. THIS PLAN IS ADAPTED FROM FIGURES AS PRESENTED IN THE SEDIMENT REMEDIAL INVESTIGATION REPORT (MWH, 2006).
9. PERIMETER OF WET AREAS ADAPTED FROM A FACILITY-WIDE WETLAND ASSESSMENT CONDUCTED MAY THROUGH JULY 2011 BY ARCADIS. THESE BOUNDARIES HAVE NOT BEEN FIELD VERIFIED AND/OR APPROVED BY NJDEP - DIVISION OF LAND USE REGULATION VIA A LETTER INTERPRETATION.

NOTES:

1. THESE FILES ARE IN THE NORTH AMERICAN DATUM 1983 NEW JERSEY STATE PLANE COORDINATE SYSTEM. THE TOPOGRAPHIC FILE REFERENCES THE NORTH AMERICAN VERTICAL DATUM 1988. THE FACILITY GRID SYSTEM WAS HISTORICALLY DEVELOPED BY HERCULES INCORPORATED TO AID SITE MANAGEMENT, AND THE GRID LINES ARE NOT ORIENTED TO TRUE NORTH.
2. THE BOUNDARY LINE AS DELINEATED IS APPROXIMATE AND HAS BEEN DIGITIZED FROM A MAP ENTITLED "HERCULES INCORPORATED, KENVIL PLANT PROPERTY MAP, PLANT 080, ACCOUNT 9500, CLASSIFICATION 21045, FILE CODE 9WE REVISION 1" REVISED TO JUNE 11, 1970 PROVIDED BY REPRESENTATIVES OF HERCULES, INC., AND THE TAX MAP OF THE TOWNSHIP OF ROXBURY AND NOT FROM AN ACTUAL FIELD SURVEY OR WITH THE BENEFIT OF A TITLE SEARCH.
3. SEDIMENT REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SURFACE WATER/SEDIMENT SITE INVESTIGATION (SW/SD-SI) REPORT (MWH, 2004).
4. PHASE 2 SEDIMENT REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SEDIMENT REMEDIAL INVESTIGATION REPORT (MWH, 2006)
5. SEDIMENT ANALYTICAL SAMPLE RESULTS WERE COMPARED TO CRITERIA DERIVED FROM THE FOLLOWING APPLICABLE SEDIMENT BENCHMARKS: NJDEP FRESHWATER SEDIMENT SCREENING GUIDELINES (FSSG) LOWEST EFFECTS LEVEL (LEL) AND SEVERE EFFECTS LEVEL (SEL), 1996, OAK RIDGE NATIONAL LABORATORY RISK ASSESSMENT INFORMATION SYSTEM (RAIS); ECOLOGICAL RISK ASSESSMENT FRESHWATER SEDIMENT SCREENING BENCHMARKS (SSB).
6. ANALYTICAL SAMPLES PRESENTED ON THIS FIGURE WERE COLLECTED DURING THE SITE AND REMEDIAL INVESTIGATIONS. THE HIGHER CONCENTRATION IS PRESENTED FOR MULTIPLE DEPTH SAMPLES.
7. THE LOWEST EFFECTS LEVEL (LEL) FOR PYRENE IS 0.195 mg/kg AND THE SEVERE EFFECTS LEVEL (SEL) IS 850 mg/kg [NJDEP-FSSG].
8. SOLID BROWN LINES REPRESENT DRY STREAM SEGMENTS OR FORMER DITCHES THAT NO LONGER CONVEY WATER SINCE MANUFACTURING OPERATIONS HAVE CEASED. THESE AREAS ARE NO LONGER CONSIDERED SURFACE WATER OR SEDIMENT BODIES AND ARE CONSIDERED SOIL IN THE REMEDIAL INVESTIGATION REPORT.
9. DASHED BROWN LINES REPRESENT STREAM SEGMENTS OR AREAS WITHOUT SUFFICIENT WATER PRESENT FOR SURFACE WATER SAMPLE COLLECTION, HOWEVER SATURATED SEDIMENTS ARE PRESENT.
10. THIS PLAN IS ADAPTED FROM FIGURES AS PRESENTED IN THE SEDIMENT REMEDIAL INVESTIGATION REPORT (MWH, 2006).
11. PERIMETER OF WET AREAS ADAPTED FROM A FACILITY-WIDE WETLAND ASSESSMENT CONDUCTED MAY THROUGH JULY 2011 BY ARCADIS. THESE BOUNDARIES HAVE NOT BEEN FIELD VERIFIED AND/OR APPROVED BY NJDEP - DIVISION OF LAND USE REGULATION VIA A LETTER INTERPRETATION.

NOTES:

1. THESE FILES ARE IN THE NORTH AMERICAN DATUM 1983 NEW JERSEY STATE PLANE COORDINATE SYSTEM. THE TOPOGRAPHIC FILE REFERENCES THE NORTH AMERICAN VERTICAL DATUM 1988. THE FACILITY GRID SYSTEM WAS HISTORICALLY DEVELOPED BY HERCULES INCORPORATED TO AID SITE MANAGEMENT, AND THE GRID LINES ARE NOT ORIENTED TO TRUE NORTH.
2. THE BOUNDARY LINE AS DELINEATED IS APPROXIMATE AND HAS BEEN DIGITIZED FROM A MAP ENTITLED "HERCULES INCORPORATED, KENVIL PLANT PROPERTY MAP, PLANT 080, ACCOUNT 9500, CLASSIFICATION 21045, FILE CODE 5WE REVISION 1" REVISED TO JUNE 11, 1970 PROVIDED BY REPRESENTATIVES OF HERCULES, INC., AND THE TAX MAP OF THE TOWNSHIP OF ROXBURY AND NOT FROM AN ACTUAL FIELD SURVEY OR WITH THE BENEFIT OF A TITLE SEARCH.
3. SEDIMENT REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SURFACE WATER/SEDIMENT SITE INVESTIGATION (SW/SED-SI) REPORT (MWH, 2004).
4. PHASE 2 SEDIMENT REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SEDIMENT REMEDIAL INVESTIGATION REPORT (MWH, 2006)
5. SEDIMENT ANALYTICAL SAMPLE RESULTS WERE COMPARED TO CRITERIA DERIVED FROM THE FOLLOWING APPLICABLE SEDIMENT BENCHMARKS: NJDEP FRESHWATER SEDIMENT SCREENING GUIDELINES (FSSG) LOWEST EFFECTS LEVEL (LEL) AND SEVERE EFFECTS LEVEL (SEL), 1998; OAK RIDGE NATIONAL LABORATORY RISK ASSESSMENT INFORMATION SYSTEM (RAIS); ECOLOGICAL RISK ASSESSMENT FRESHWATER SEDIMENT SCREENING BENCHMARKS (SSB).
6. ANALYTICAL SAMPLES PRESENTED ON THIS FIGURE WERE COLLECTED DURING THE SITE AND REMEDIAL INVESTIGATIONS. THE HIGHER CONCENTRATION IS PRESENTED FOR MULTIPLE DEPTH SAMPLES.
7. THE LOWEST EFFECTS LEVEL (LEL) FOR ACENAPHTHYLENE IS 0.00587 mg/kg AND THE SEVERE EFFECTS LEVEL (SEL) ARE LISTED BELOW (NJDEP-FSSG).

CALCULATED ACENAPHTHYLENE SELs (mg/kg)			
Intermittent Streams	Streams	Wet Areas	Ponds
0.009	0.01	0.02	0.03

8. SOLID BROWN LINES REPRESENT DRY STREAM SEGMENTS OR FORMER DITCHES THAT NO LONGER CONVEY WATER SINCE MANUFACTURING OPERATIONS HAVE CEASED. THESE AREAS ARE NO LONGER CONSIDERED SURFACE WATER OR SEDIMENT BODIES AND ARE CONSIDERED SOIL IN THE REMEDIAL INVESTIGATION REPORT.
9. DASHED BROWN LINES REPRESENT STREAM SEGMENTS OR AREAS WITHOUT SUFFICIENT WATER PRESENT FOR SURFACE WATER SAMPLE COLLECTION, HOWEVER SATURATED SEDIMENTS ARE PRESENT.
10. THIS PLAN IS ADAPTED FROM FIGURES AS PRESENTED IN THE SEDIMENT REMEDIAL INVESTIGATION REPORT (MWH, 2006).
11. PERIMETER OF WET AREAS ADAPTED FROM A FACILITY-WIDE WETLAND ASSESSMENT CONDUCTED MAY THROUGH JULY 2011 BY ARCADIS. THESE BOUNDARIES HAVE NOT BEEN FIELD VERIFIED AND/OR APPROVED BY NJDEP - DIVISION OF LAND USE REGULATION VIA A LETTER INTERPRETATION.

THE BOUNDARY LINE AS DELINEATED IS APPROXIMATE AND HAS BEEN DIGITIZED FROM A MAP ENTITLED "HERCULES INCORPORATED, KENVIL PLANT PROPERTY MAP, PLANT 080, ACCOUNT 9500, CLASSIFICATION 21045, FILE CODE 5WE REVISION 1" REVISED TO JUNE 11, 1970 PROVIDED BY REPRESENTATIVES OF HERCULES, INC., AND THE TAX MAP OF THE TOWNSHIP OF ROXBURY AND NOT FROM AN ACTUAL FIELD SURVEY OR WITH THE BENEFIT OF A TITLE SEARCH.
3. SEDIMENT REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SURFACE WATER/SEDIMENT SITE INVESTIGATION (SWI/SD-SI) REPORT (MWH, 2004).
4. PHASE 2 SEDIMENT REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SEDIMENT REMEDIAL INVESTIGATION REPORT (MWH, 2006)
5. SEDIMENT ANALYTICAL SAMPLE RESULTS WERE COMPARED TO CRITERIA DERIVED FROM THE FOLLOWING APPLICABLE SEDIMENT BENCHMARKS: NJDEP FRESHWATER SEDIMENT SCREENING GUIDELINES (FSSG) LOWEST EFFECTS LEVEL (LEL) AND SEVERE EFFECTS LEVEL (SEL), 1998; OAK RIDGE NATIONAL LABORATORY RISK ASSESSMENT INFORMATION SYSTEM (RAIS); ECOLOGICAL RISK ASSESSMENT FRESHWATER SEDIMENT SCREENING BENCHMARKS (SSB).
6. ANALYTICAL SAMPLES PRESENTED ON THIS FIGURE WERE COLLECTED DURING THE SITE AND REMEDIAL INVESTIGATIONS. THE HIGHER CONCENTRATION IS PRESENTED FOR MULTIPLE DEPTH SAMPLES.
7. THE LOWEST EFFECTS LEVEL (LEL) FOR LEAD IS 31 mg/kg AND THE SEVERE EFFECTS LEVEL (SEL) IS 250 mg/kg [NJDEP-FSSG].
8. SOLID BROWN LINES REPRESENT DRY STREAM SEGMENTS OR FORMER DITCHES THAT NO LONGER CONVEY WATER SINCE MANUFACTURING OPERATIONS HAVE CEASED. THESE AREAS ARE NO LONGER CONSIDERED SURFACE WATER OR SEDIMENT BODIES AND ARE CONSIDERED SOIL IN THE REMEDIAL INVESTIGATION REPORT.
9. DASHED BROWN LINES REPRESENT STREAM SEGMENTS OR AREAS WITHOUT SUFFICIENT WATER PRESENT FOR SURFACE WATER SAMPLE COLLECTION, HOWEVER SATURATED SEDIMENTS ARE PRESENT.
10. THIS PLAN IS ADAPTED FROM FIGURES AS PRESENTED IN THE SEDIMENT REMEDIAL INVESTIGATION REPORT (MWH, 2006).
11. PERIMETER OF WET AREAS ADAPTED FROM A FACILITY-WIDE WETLAND ASSESSMENT CONDUCTED MAY THROUGH JULY 2011 BY ARCADIS. THESE BOUNDARIES HAVE NOT BEEN FIELD VERIFIED AND/OR APPROVED BY NJDEP - DIVISION OF LAND USE REGULATION VIA A LETTER INTERPRETATION.

NOTES:

1. THESE FILES ARE IN THE NORTH AMERICAN DATUM 1983 NEW JERSEY STATE PLANE COORDINATE SYSTEM. THE TOPOGRAPHIC FILE REFERENCES THE NORTH AMERICAN VERTICAL DATUM 1988. THE FACILITY GRID SYSTEM WAS HISTORICALLY DEVELOPED BY HERCULES INCORPORATED TO AID SITE MANAGEMENT, AND THE GRID LINES ARE NOT ORIENTED TO TRUE NORTH.
2. THE BOUNDARY LINE AS DELINEATED IS APPROXIMATE AND HAS BEEN DIGITIZED FROM A MAP ENTITLED "HERCULES INCORPORATED, KENVIL PLANT PROPERTY MAP, PLANT 080, ACCOUNT 9500, CLASSIFICATION 21045, FILE CODE 5WE REVISION 1" REVISED TO JUNE 11, 1970 PROVIDED BY REPRESENTATIVES OF HERCULES, INC., AND THE TAX MAP OF THE TOWNSHIP OF ROXBURY AND NOT FROM AN ACTUAL FIELD SURVEY OR WITH THE BENEFIT OF A TITLE SEARCH.
3. SEDIMENT REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SURFACE WATER/SEDIMENT SITE INVESTIGATION (SW/SD-SI) REPORT (MWH, 2004).
4. PHASE 2 SEDIMENT REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SEDIMENT REMEDIAL INVESTIGATION REPORT (MWH, 2006)
5. SEDIMENT ANALYTICAL SAMPLE RESULTS WERE COMPARED TO CRITERIA DERIVED FROM THE FOLLOWING APPLICABLE SEDIMENT BENCHMARKS: NJDEP FRESHWATER SEDIMENT SCREENING GUIDELINES (FSSG) LOWEST EFFECTS LEVEL (LEL) AND SEVERE EFFECTS LEVEL (SEL), 1998; OAK RIDGE NATIONAL LABORATORY RISK ASSESSMENT INFORMATION SYSTEM (RAIS); ECOLOGICAL RISK ASSESSMENT FRESHWATER SEDIMENT SCREENING BENCHMARKS (SSB).
6. ANALYTICAL SAMPLES PRESENTED ON THIS FIGURE WERE COLLECTED DURING THE SITE AND REMEDIAL INVESTIGATIONS. THE HIGHER CONCENTRATION IS PRESENTED FOR MULTIPLE DEPTH SAMPLES.
7. THE LOWEST EFFECTS LEVEL (LEL) HAS NOT BEEN ESTABLISHED FOR ANTIMONY AND THE SEVERE EFFECTS LEVEL (SEL) IS 3 mg/kg [NJDEP-FSSG].
8. SOLID BROWN LINES REPRESENT DRY STREAM SEGMENTS OR FORMER DITCHES THAT NO LONGER CONVEY WATER SINCE MANUFACTURING OPERATIONS HAVE CEASED. THESE AREAS ARE NO LONGER CONSIDERED SURFACE WATER OR SEDIMENT BODIES AND ARE CONSIDERED SOIL IN THE REMEDIAL INVESTIGATION REPORT.
9. DASHED BROWN LINES REPRESENT STREAM SEGMENTS OR AREAS WITHOUT SUFFICIENT WATER PRESENT FOR SURFACE WATER SAMPLE COLLECTION, HOWEVER SATURATED SEDIMENTS ARE PRESENT.
10. THIS PLAN IS ADAPTED FROM FIGURES AS PRESENTED IN THE SEDIMENT REMEDIAL INVESTIGATION REPORT (MWH, 2006).
11. PERIMETER OF WET AREAS ADAPTED FROM A FACILITY-WIDE WETLAND ASSESSMENT CONDUCTED MAY THROUGH JULY 2011 BY ARCADIS. THESE BOUNDARIES HAVE NOT BEEN FIELD VERIFIED AND/OR APPROVED BY NJDEP - DIVISION OF LAND USE REGULATION VIA A LETTER INTERPRETATION.

NOTICE OF DEFICIENCY

Re: Draft Remedial Investigation Report
Hercules Incorporated, Kenvil Works (aka Alliant)
100 Howard Boulevard
Roxbury Township, Morris County, New Jersey
SRP PI# 000741

Dear Mr. Hough:

The New Jersey Department of Environmental Protection (Department or NJDEP) acknowledges receipt of the Remedial Investigation Report (RIR) on May 31, 2007, and the Additional Ground Water Remedial Investigation Sampling Report (AGWRI) on June 24, 2009. The RIR and the AGWRI were prepared by MWH Americas, Inc., and Environmental Alliance, Inc., respectively, on behalf of Hercules, Inc. (Hercules). The documents were submitted pursuant to the Industrial Site Recovery Act regulations at N.J.A.C. 7:26B (ISRA Rule), the Remediation Agreement executed on March 10, 1995 and the Technical Requirements for Site Remediation at N.J.A.C. 7:26E (Tech Regs).

As agreed to by the Department, Hercules prepared and submitted the RIR as five (5) separate volumes: four media-specific volumes (Volumes B through E) to address soil, ground water, sediment and surface water, and one summary volume (Volume A) to evaluate the data across all media. The discussions in Volume A focused on the three areas (Areas I, II and III) previously devised by Hercules and are loosely based on redevelopment potential, historic operations, contamination identified in the Site Investigation (SI), and ease of future remedial actions. This format was agreeable because of the large amount of data (4,400 samples) collected as part of the SI and RI, and the large area of the site (1200 acres). However, upon review of the RIR, it became apparent to DEP that Areas I, II and III, and even the "production areas" within each

Area, are too large to allow for valuable data interpretation and discussion. Plus, the Tech Regs require RI of contaminated sites to address specific Areas of Concern (AOCs).

This information was conveyed to Hercules in various conversations, emails and meetings. In response, Hercules sent a letter to DEP dated December 1, 2009 discussing the approach Hercules intends to follow to complete the RI at this site. Proposed activities include completion of a Case Inventory Document (CID) to describe the large number of previously identified AOCs followed by a second phase of sampling to evaluate individual and groupings of similar and/or related AOCs.

This revised approach is acceptable to DEP, however, the RIR, as written, does not conform to the Remediation Agreement and the Tech Rule and reflects the following deficiency:

Deficiency

Failure to conduct a remedial investigation in accordance with 7:26E-4, including delineation of contamination to the applicable remediation standards in all media pursuant to the Department's guidance, determination of off-site migration of contamination, and evaluation of impacts to human and ecological receptors. [N.J.A.C. 7:26E-4.1(b)]

In addition to the above deficiency, DEP has numerous comments on the RIR that must be addressed in the final RIR. The comments have been enclosed for your convenience.

Corrective Actions

To correct the deficiency and address the enclosed comments, please take the following actions or make the required submittals within the timeframes indicated:

Submit within 180 calendar days of receipt of this letter a CID that includes all AOCs, including those that were previously identified in the SI phase in accordance with N.J.A.C. 7:26E-4.2(b)11.

Submit within 18 months of receipt of this letter, a Phase II Remedial Investigation Report documenting completion of the RI to the applicable remediation standards in all media pursuant to the Department's guidance, determination of off-site migration of contamination, and evaluation of impacts to human and ecological receptors in accordance with N.J.A.C. 7:26E-4.8.

Note that if deficiencies included herein are not addressed to the Department's satisfaction within the specified time period the Department will consider them to be violations and may assess penalties pursuant to N.J.A.C. 7:26C-10.

If you require copies of Department Guidance Documents or applications, many of these are available on the internet http://www.state.nj.us/dep/srp. If you have any questions or

would like to schedule a meeting regarding this matter contact me by telephone at (609)633-1494, or by email at Donna.Gaffigan@dep.state.nj.us, prior to the date indicated.

Sincerely,

Donna L. Gaffigan, Case Manager
Bureau of Case Management

General Comments
Volumes A, B, C, D & E

As agreed to by NJDEP, the RIR was submitted as five separate volumes with the last (Volume A) submitted to pull together the information from the other four volumes into a summary narrative. The five volumes of the RIR are:

- Volume A- Summary
- Volume B- Soil
- Volume C - Groundwater
- Volume D - Sediment
- Volume E – Surface Water

The Executive Summary presented in Volume A states that the RIR is the culmination of two major field investigations (SI and RI) spanning more than eight years. The main findings of the RIR are summarized in as follows:

- There is a explosives and energetics influenced groundwater plume in the southwest corner of the property in Area II that will require additional delineation. There is no evidence of any other potential off-site contamination caused by site related constituents.
- The nature and extent of contamination is generally well delineated. The need for any further delineation is minor. Any additional delineation should be effectively completed as remedy pre-design or remedial action activities with the benefit of the known future use of the facility. The data presented in the RIR provides a sound basis to perform a remedial alternatives analysis and begin the remedy selection process.
- Based on site-wide characterization and conceptual site model, there is no unacceptable on-site human health risk. There is no unacceptable off-site human health risk with the possible exception of the energetics and explosives influenced groundwater plume in the southwest portion of the property. No containment or stabilization activities are necessary to prevent on-site exposure or off-site migration of site related constituents for soil, sediment, or surface water.

NJDEP does not agree with these findings in their entirely:

- NJDEP can agree that the groundwater plume in the southwest corner of the site requires additional delineation. However, NJDEP cannot yet agree that there is no off-site contamination caused by site related constitutents. There are questions about the surface water and sediment data as discussed in the following comments. In addition, the western ridge is referred to as a no-flow boundary, that eliminates the potential for ground water in the valley fill aquifer to migrate westerly. While this may be true, it has not been confirmed. In addition, this area of the site is known to have faults, folds and fractures; all of which have the potential to act as ground water migration pathways. As such, it is recommended

that Hercules refrain from the use of definitive statements unless/until they can be verified.

- NJDEP can agree that the nature and extent of contamintion is *generally defined.* Because of the vast size of the site and the large number of areas of concern (ACOs) previously identified in the SI, the RI soil sampling program was approved to proceed in using a grid pattern to cover the entire site, with numerous additional samples collected in specific locations to supplement the SI data. However, based upon review of the data, additional delineation is required, particularly to more specifically define if and how contamination source areas in the soil are impacting other medial and to evaluate impacts to receptors. An evaluation of the site by evaluating each area of concern (AOC) appears to be the best way forward. Completion of the CID form will assist in identifying all of the AOCs along with the impacted media, contaminants of concern, receptors and current status.

  NJDEP agrees that the data presented in the RIR allows Hercules to begin the remedy selection process.

- NJDEP believes the finding that there is no unacceptable on-site human health risk is misleading as it indicates that the contamination on the site is minimal. This overlooks the fact that there are some very contaminated areas on the site that have clearly impacted the site surface and subsurface soils, sediment, ground water and surface water. Hercules' finding that there is no unacceptable human health risk is only accurate if the future land use remains unchanged. Current land use is vacant with site access is restricted to appropprietely trained personnel. Public access is currently restricted; the site is fenced, monitored by security personnel and ringed with no trespassing signs. The conclusion must be revised to clearly state that the concentrations of contaminants found in the site soil and groundwater would present a high exposure risk if reuse were to occur without extensive remediation efforts.

  In addition, the statement that "no containment or stabilization activities are necessary to prevent on-site exposure or off-site migration of site related constituents for soil, sediment, or surface water" is premature because the on-site exposure risk to ecological receptors has not been accessed pursuant to N.J.A.C. 7:26E-4.1(a)5 and 7:26E-4.7.

NJDEP's general comments on the RI in its entirely are included in the first section below. Specific comments on individual Volumes A through E appear in subsequent sections.

1. New Jersey promulgated its Remediation Standards, N.J.A.C. 7:26D on June 2, 2008. The CID and all subsequant documents shall make proper reference to these standards. Additional site-specific cleanup *criteria* will be provided to Hercules under separate cover.

2. NJDEP finds that information concerning soil to groundwater and surface water interaction, and impacts to surface water system media and receptors, is not adequately discussed in the RIR narrative to draw informed conclusions. Information provided in the SI and RIR must be pulled together in the RIR narrative in Volume A. This discussion must include the boring log and test pit observations, as well as previous geophysical work and removal actions that have occurred at specific AOCs. The RIR must identify and discuss the areas where the data indicates that contaminants are being transported into streams and ponds. The discussion must include an assessment of whether or not these interactions are continuing or have been abated. Completion of the CID should assist with this effort.

3. After careful review of this RIR, it is difficult to determine if the areas of concern on the site have been adequately delineated according to 7:26E-4.1(b). The RIR does not discuss any of the AOCs and many are not clearly shown on site figures. The RIR must discuss the nature and extent of contamination detected in each significant AOC. The AOCs should be clearly depicted on relevant site figures which include delineation sample locations and text boxes with concentrations of COCs detected above NJDEP criteria. The RIR narrative must summarize the sample data for each AOC area including contaminant type, concentration range and depth and discuss whether or not the contamination has been delineated and is having an impact on groundwater or nearby sediment or surface water receptors.

4. In some areas, product material was observed in soil borings or test pits. It must be clarified if the product material was sampled. While soil sample and groundwater sample data has been provided in the RIR Tables, there was no narrative or other attempt to correlate boring or test pit logs observations with the analytical data in the text of the RIR. This is a serious omission as it affects the determination of compliance with source delineation requirements at N.J.A.C. 7:26E-3.4(a) and N.J.A.C. 7:26E-4.4(h)3(i).

5. Cross sections shall include the boring observations in addition to sample results pursuant to N.J.A.C. 7:26E-4.8(c)5.

6. There was extensive use and storage of acetone at many of the AOCs including within the A Line, B Line, PETN Area, Development Area, and Finishing Area. Justification must be provided for not analyzing groundwater samples for acetone in these areas pursuant to N.J.A.C. 7:26E-3.4.

7. The site history mentions that sulfuric acid production occurred at the site. Pursuant to N.J.A.C. 7:26E:3.1(b)1iv, the RIR must indicate what process of sulfuric acid production was used at the site. If the lead chamber process was used at the facility, the RIR must include discussion of whether there was processing or storage of arsenopyrite ores at the site.

8. There is too much information provided on some single figures, making them difficult to understand. AOC-specific figures for significant AOCs shall be provided. These figures must include all AOC sample locations and exceedances and can be imbedded within the RIR narrative.

9. The boring and test pit logs and data tables were not labeled with respect to their specific AOC location pursuant to N.J.A.C. 7:26E-4.8(d)1. Going back and forth between the RI sampling summary tables and the figures and boring logs in order to link them to an AOC, and then sort the logs by AOC, was a very cumbersome process.

Specific Comments
Volume A - Summary

1. **Executive Summary** - See General Comment Nos. 1 and 2, above.

2. **Section 6.0 RI Conclusions** - See General Comment Nos. 1 and 2, above.

3. **Section 6.1.2 Historic Fill** – Please refer to comment for Volume B, Section 5.5, below.

4. **Section 6.1.4 Analytical Results** - It is stated on page A-6-4 that "limited influence to groundwater from constituents in soil were noted across the site with the exception of two areas: These are:

   The southern area of Grid L10 and northern area of Grid L11 where soil samples contain trinitrotoluene (TNT) and dinitrotoluene (DNT), and groundwater samples (specifically MW-27) have TNT breakdown products at concentrations exceeding New Jersey Ground Water Quality Standards (GWQS).

   "The TNT Area, the Pentaerythritol Tetranitrate (PETN) Area, and the western Dynamite and Nitroglycerine (NG) Areas all have soils with constituents detected at concentrations exceeding the IGWSCC and show a connection to groundwater quality in the area. Groundwater samples taken in these areas indicate TNT, TNT breakdown constituents and NG exceeding the GWQS."

   The RIR must discuss whether or not there are any discrete AOC source areas within Area II that are acting as a continuing source of groundwater contamination. Is the source of the groundwater impact from the high concentrations of TNT and other explosives scattered throughout the soil in this general area? Or are there any discrete source areas such as red water lagoons, gravel pits, former settling ponds, or debris from a former production area such as a former grinding house or filter house?

5. **Section 6.3 Sediment RI Conclusions** - As stated in the comment for Volume B, Section 5.5, NJDEP cannot agree at this time that semi-volatile organic compounds (SVOCs) and metals detected at concentrations exceeding the sediment Lowest Effects Level (LEL) or Severe Effects Level (SEL) are associated with emplacement of historic fill. This has not yet been proven and this statement may need to be changed based on further characterization and delineation.

6. **Section 6.4.4 Surface Water RI Conclusions** - NJDEP cannot agree with the statement on page A-6-17 that the source of the polynuclear aromatic hydrocarbons (PAHs), and total metals in the surface water samples is solely historic fill at the site. Hercules has not provided sufficient data to prove that the source of the PAHs and total metals is not due to site related activities in the vicinity of the Duck Pond and Tributaries. This statement is not currently supported by the data provided and may need to be changed based on further characterization and delineation.

7. **Section 6.4.4 Surface Water RI Conclusions** - NJDEP cannot agree with the statement on page A-6-17, that dissolved metals detected at concentrations exceeding the SWQS in the Duck Pond and Tributaries is attributed to naturally occurring tannic acid produced from decaying hardwood vegetation. Hercules has not provided sufficient data to prove that the source of the dissolved metals is not related to site-specific disposal and burning ground operations especially in the vicinity of the K5 Pond and other Duck Pond Tributaries. This statement is not currently supported by the site data and may need to be changed based on further characterization and delineation. Site related impacts are particularly likely in the Central and Eastern Drainage Areas, Miscellaneous Ponds in the NG Area, and Duck Pond and Tributaries and Ponds.

8. **Section 6.4.4 Surface Water RI Conclusions** - Surface Water sampling is required in the miscellaneous ponds in the NG Area where elevated metals (lead) have been detected in sediments. Apparently no surface water samples have been collected from this area.

9. **Section 6.4.4 Surface RI Water Conclusions** - Additional surface water sampling is required in the northern and western portions of the Duck Pond and its northwestern stream tributary, due to data gaps.

10. **Section 6.5 Summary of RI Conclusions** - Second Bullet: Hercules states that the need for any additional delineation of the nature and extent of contamination at the site is minor, and does not affect the site wide characterization of environmental media. The conclusion further states that any further delineation would most effectively be completed as a remedy pre-design. NJDEP believes that this statement is premature pending resolution of the comments.

11. **Section 7.2.1, Primary Analytical Groups of Concern** - The conclusion on page A-7-5 that SVOC PAHs are attributed to historic fill is not currently supported by the RI data. This statement may need to be changed as indicated in comments above.

12. **Section 7.2.1, Primary Analytical Groups of Concern** - The conclusion on page A-7-5 that dissolved metals are attributed to naturally occurring tannic acid is not currently supported by the site data. This statement may need to be changed as indicated above.

13. **Section 8.0 Future Actions** - NJDEP recommends that in addition to the proposed sampling activities identified in Sections 8.1 -8.3, Hercules consider the following additional sampling activities:

    - Central Drainage Area: Additional delineation of surface water and groundwater impacts is required since there is no surface water data from the miscellaneous ponds in Grids C11 and D11 which exhibited very high concentrations of lead in sediment.

- Duck Pond and Tributaries Drainage Area: Additional delineation of surface water is required in the northern and western portions of the Duck Pond to evaluate the impacts from contaminant source areas in these portions of the site.
- Duck Pond and Tributaries Drainage Area: Additional characterization of sediment is required in the eastern portions of the Duck Pond to evaluate the impacts contaminant source areas in these portions of the site.
- Western Drainage Area: Vertical delineation of explosive contamination in sediments.

14. **Section 8.0 Future Actions** - Additional delineation may be required in other AOCs on the site depending on Hercules response to many of the comments above. This includes:

    - Sampling from test pits and borings where significant contamination or product material was encountered. This may include areas within the M5 disposal area and burning ground, N6 and M8 disposal areas and other areas indicated in the above comments.
    - Delineation at surface impoundments or test pits in the B13 grid area/red water lagoon.
    - Surface soil sampling from the 0-6" interval from various AOCs throughout the site, particularly burning grounds and areas where surface discharges may have occurred.
    - Sample all burning grounds soils with analyses for dioxins. Confirm that all past burning ground AOCs have been sampled for PCBs, in addition to explosives, VOCs, SVOCs and metals.
    - Horizontal and vertical delineation of explosive contamination is required to delineate the extent of TNT and other explosives in Area II in all directions around TP-R-C13-666-1,2,4 and 5 and SB-R-D14. It must be clarified whether or not wetland sediments in this vicinity have been characterized.
    - In general, clarification is required that the TNT hotspots in Area II, identified on Figure B-38, have been adequately delineated. Clean zone samples must be identified.

15. **Section 8.1 Future Actions Ground Water Sampling** - The proposed additional sampling is acceptable. Hercules should ensure that both horizontal and vertical delineation activities are conducted. For the southwestern plume, this must include off-site delineation.

16. **Appendix J, Facility Background Information** - This section of the RIR should include summary information regarding each of the AOCs investigated in the SI and RI.

Specific Comments
Volume B - Soil

1. **Section 2.4 Soil Sampling** - Horizontal delineation: It is stated on page B-2-4 that horizontal delineation soil samples "were collected from a 6 inch interval from 0-2' below ground surface (bgs) biased to the interval with the highest potential environmental concern." Tables indicate that most surface soil samples were collected from 6-12" interval. This is deficient according to NJAC 7:26E-3.6(a)3 which states that initial characterization soil samples (except VOC samples) shall be collected at 0-6 inches below grade except as required pursuant to NJAC 7:26E-3.9. Clarification or justification must be provided for not collecting horizontal delineation and surface characterization soil samples from the top 0-6" interval.

2. **Section 2.4 Soil Sampling** - Vertical delineation: The first paragraph on page B-2-5 states that vertical delineation soil samples were collected from "the first 6-inch interval of native soils encountered. If evidence of potential environmental concern was observed, the first 6-inch interval below the potential environmental concern was sampled." It appears from the wording that soil samples were collected from 0-6" below the areas of greatest contamination. This sampling procedure is deficient according to N.J.A.C. 7:26E-3.4(a)1 which requires that all soil samples must be biased to the suspected location of greatest contamination. Clarification on this issue is required.

3. **Section 2.4.1.3 Soil Sampling at SI AOCs Reserved for the RI** - Forty-four (44) AOCs were reserved for the RI during the SI based on existing analytical data or if field observations (made during the SI) indicated that various constituents would likely exceed the applicable direct contact residential soil cleanup criteria. All 44 AOCs are presented on Figure B-46 and Tables B2-1, B3-1, B4-1, and B5-1. As stated in the above comments, it appears that no (0-6") were collected from any of the AOCs. This must be clarified and justification must be provided for not collecting surface soil samples from the top 6" as required by N.J.A.C. 7:26E-3.6(a)3. The RIR narrative must provide some historical information regarding the nature of these AOCs. In addition, Figure B-46 should be revised or some other figure added to include the sample locations and relevant data that are used to determine the nature and extent of contamination at each of these AOCs.

4. **Section 2.4.1.3 Soil Sampling at SI AOCs Reserved for the RI** - It is stated on page B-2-9 that 80 exploratory visual observation soil borings were advanced around the perimeter of the four largest AOCs (B13-2, M5-3, M8-1 and N6-1) to better define the AOC boundaries. The reader is referred to the boring logs, which are provided in Appendix B. However, the exploratory borings are not identified and the text of the RIR does not discuss the results of these exploratory borings. Therefore, it is not possible for a reviewer to know which boring logs to review to determine if the exploratory boring program has accomplished the stated objective of visually delineating the boundaries of the AOCs. The text of the RIR must identify the exploratory borings and discuss the observations and conclusions of this part of the

investigation. The RIR makes no attempt to interpret the observations from these borings or to define the AOC boundaries. This must be provided. Also, a figure must be provided to present the results of this effort.

5. **Section 2.4.1.3 Soil Sampling at SI AOCs Reserved for the RI** - Analytical Sampling: It is stated on page B-2-9 that "If field screening and professional judgment indicated that significant quantities of E&E were present, samples were not collected directly from the interval with the highest potential of environmental concern. In these cases, samples were collected directly below the interval due to health and safety concerns. This practice was used in a limited number of AOCs predominantly located in the TNT Area and western Dynamite Area." The text must identify the specific samples where this practice was used and the significance of not collecting a sample from the most contaminated zone in these potential source areas.

6. **Section 2.4.2 Site-Wide Grid-Based Soil Sampling Strategy** - It is stated on page B-2-10 that the majority of the RI samples were collected using a grid-based approach. Soil sample locations were placed at a frequency of every 250-ft. This sampling approach is acceptable for diffuse areas of contamination. However, additional samples will be required to complete delineation of specific AOCs, where field observations indicate that a more AOC sampling specific approach is required.

7. **Section 2.4.4 Recently Identified AOCs Not Previously Investigated** - It is stated on page B-2-12 that eight additional AOCs (debris areas) were identified in the RI field activities. The RIR states that these areas may have been historically low-lying portions of the Facility that were filled with debris (historic fill, scrap steel/iron, and general refuse). A total of nine exploratory visual observation test pits were reportedly excavated to a maximum depth of 9-ft. bgs in the center of each AOC. No analytical samples were collected. The RIR indicates that these test pits were visually inspected and classified, but no samples were collected. The intention of the test pits was to provide a preliminary assessment of the nature of the debris present within each area. The RIR states that the soil boring logs are provided in Appendix B and photos are presented in Appendix C and that the recently identified debris areas will be addressed in the future actions work plan included in Volume A. It is not possible to review this information because the boring logs could not be located and the RIR does not discuss the test pit results. The RIR must provide the exploratory test pit logs, discuss the observations and make some interpretation of the observations within the text of the RIR.

8. **Section 2.4.5 Sample Locations Proposed But Not Sampled** - It is stated on page B-2.13 that all proposed soil samples were collected during the RI with the exception of 20 samples that could not be collected due to refusal or lack of recovery. These missing soil samples are identified in Section 2.4.5, however specific information is lacking. Additional information must be provided regarding these missing samples including the AOC that each were to be located in and the significance of the missing data on AOC specific delineation. The proposed location of these missing samples must be shown on a site figure.

9. **Section 5.1.1 Soil Quality Standards** - It is stated on page B-5-4 that the only SI exceedances for constituents with criteria updated since the SI are summarized in this RIR. The complete SI results are attached as a supplement disk to the RIR. The RIR should present and discuss all SI and RI data exceedances in the RIR narrative. This is needed to obtain a complete picture of site wide contamination and to ensure appropriate delineation has been accomplished. Completion of the CID should assist with this.

10. **Section 5.2 Frequent Exceedance Constituents (FECs)** - The E&E compound 2-amino-4,6-dinitrotoluene (2-A-DNT) was found in excess of the Impact to Ground Water Soil Cleanup Criteria (IGWSCC) in 130 soil samples. This is more than 5.8 % of the samples. Also, 1,3-dinitrobnzene (DNB13) was found in 80 samples or over 3.5% of the soil samples. Unless adequate explanation is provided, both of these must be included as FECs. Also, based on the data provided, it is required that copper and zinc must be added as FEC constituents of concern in the old burning ground (M5-3) and other debris disposal areas.

11. **Section 5.3 Organization of Results** - It is stated on page B-5-12 that Figures B-46 presents SI AOCs reserved for the RI and Figure B-47 presents recently identified AOCs not previously investigated. As stated previously, these figures must show the sample locations and exploratory trenches that are being used to delineate the contamination or provide preliminary characterization at these AOCs.

12. **Section 5.5 Historic Fill Discussion** - The RIR states, on page B5-19, that over 900 test pits were advanced within Areas I and III. Test pit logs and photos are presented in Appendix E. Figure B-2 presents the locations of the historic fill test pits. The RIR states that Hercules imported potentially large quantities of fly ash, bottom ash, and slag (historic fill) from local available sources that is believed to have possessed metal and PAH constituents prior to entering the Facility. It is not certain, but believed that the former iron foundries located in Dover, New Jersey, approximately four (4) miles east of the Facility, was the primary source of historic fill. It is most likely that fly-ash, bottom ash, and slag from on-site Facility boilers were added to the imported historic fill, but the RIR indicates that this likely represented a very small fraction of the total historic fill emplaced.

    The RIR claims that the distribution of the historic fill is reported to be widespread and heterogeneously distributed across the Facility. The RIR indicates that the fill under the property and site can be characterized as "Historic Fill Material," defined in N.J.A.C. 7:26E-1.8 as "non-indigenous material, which was contaminated prior to emplacement, and is in no way connected with the operations at the location of emplacement..."

    NJDEP does not doubt that fill material from off site sources may have been used to fill low-lying areas of the site prior to development. However, many of the boring logs and test pit logs clearly indicate that the ash and slag material is mixed in the

disposal areas and site-related discharges that are clearly due to Hercules operations. Appendix J of Volume A discusses fires, explosions, land disposal and burning ground practices as well as liquid waste disposal on the ground and in unlined ditches and surface impoundments as well as numerous accidents and spills. The site history indicates that there were numerous burning grounds located in various locations around the site, including one on the northern portion of the Duck Pond. Fill material throughout the site includes debris from historic explosions and fires over the many years of operation. Drums, lead flooring and pipes and various types of debris from former buildings, including a lead smelter and various types of process equipment, as well as other waste materials were buried on site or deposited in ponds, low lying areas and other locations throughout the facility. In many of these areas, it is not possible to discern the contamination related to site-related burning and disposal activities from any potential off-site fill material.

NJDEP does not agree with the RIR, which seems to indicate that, nearly every observation of ash and slag material within an excavation should be considered historic fill. Numerous sections of the RIR also state that nearly all PAH and metals exceedances in soils, sediments, surface water and groundwater are be caused by historic fill. Based on the boring logs, analytical data and field observations as well as site history, NJDEP believes that in areas with site-related impacts it is not possible to determine whether PAH and metals contaminated soils are related to placement of historic fill or site related activities. Therefore, the conclusions regarding historic fill discussed in numerous sections of the RIR and depicted on Figure B-2 must be changed.

13. **Section 5.6.2 Area I Analytical Results** - It is stated on page B-5-28 that the majority of SVOC constituents detected at concentrations exceeding the Residential Direct Contact Soil Cleanup Criteria (RDCSCC) and Non-Residential Direct Contact Soil Cleanup Criteria (NRDCSCC) are PAHs commonly associated with historic fill. It is stated on page B-5-30, that arsenic and lead are commonly associated with historic fill. The RIR must discuss the other potential site related sources of SVOCs at these locations within Area I. As stated above, these include burning ground operations, site related debris and bullet disposal and landfilling, demolition and filling building fires and explosions, and discharges from former manufacturing operations.

14. **Section 5.6.2 Area I Analytical Results** - It is stated throughout this section that "soil samples with SVOCs, metals, E&E and PCBs detected at concentrations exceeding either the RDCSCC or NRDCSCC are located in close proximity to surface water features (Figure B-6) may locally affect the quality of surface water and sediments, although it is not the intent of this volume to fully characterize these interactions." The document is deficient pursuant to N.J.A.C.7:26E-3.13(b)4. NJDEP finds that information concerning soil to groundwater and surface water interaction, and impacts to surface water system media and receptors, is not adequately discussed in the RIR narrative to draw informed conclusions. The RIR must identify and discuss the areas where the data indicates that contaminants are

being transported into streams and ponds. The discussion must include an assessment of whether or not these interactions are continuing or have been abated.

15. **Section 5.6.4 Recently Identified AOCs Not Previously Investigated** - It is stated on page B-5-34 that seven additional AOCs (debris areas) were identified the RI field activities. These are presented on Figure B-46. The RIR states that these areas may have been historically low-lying portions of the Facility that were filled with debris (historic fill, scrap steel/iron, and general refuse). Exploratory visual observation test pits were reportedly excavated in the center of each AOC. No analytical samples were collected. The RIR indicates that these test pits were visually inspected and classified, but no samples were collected. The intention of the test pits was to provide a preliminary assessment of the nature of the debris present within each area. The RIR states that the soil boring logs are provided in Appendix B and photos are presented in Appendix C and that the recently identified debris areas will be addressed in the future actions work plan included in Volume A. It is not possible to review this information because the boring logs could not be located and the RIR does not discuss the test pit results. The RIR must provide the exploratory test pit logs, discuss the observations and make some interpretation of the observations within the text of the RIR.

16. **Section 5.7.2 Area II Analytical Results** - It is stated on page B-5-41 that the majority of SVOC constituents detected at concentrations exceeding the RDCSCC/NRDCSCC are PAHs commonly associated with historic fill. It is stated on page B-5-42, that the arsenic and lead exceedances are commonly associated with historic fill. The RIR must discuss the other potential site related sources of SVOCs and metals at these locations within Area II. As stated above, these include burning ground operations, site related debris disposal including lead flooring and other sources and landfilling, demolition and filling, building fires and explosions, and discharges from former manufacturing operations.

17. **Section 5.7.2 Area II Analytical Results** – Please refer to the comment for Section 5.6.2, above, regarding soil, groundwater, surface water, and sediment interactions.

18. **Section 5.8.2 Area III Analytical Results** - It is stated on page B-5-53 that the majority of SVOC constituents detected at concentrations exceeding the RDCSCC/NRDCSCC are PAHs commonly associated with historic fill. It is stated on page B-5-54, that the arsenic and lead exceedances are commonly associated with historic fill. The RIR must discuss the other potential site related sources of SVOCs and metals at these locations within Area II. As stated above, these include burning ground operations, site related debris disposal including lead flooring and other sources and landfilling, demolition and filling, building fires and explosions, and discharges from former manufacturing operations.

19. **Section 5.8.2 Area III Analytical Results** – Please refer to the comment for Section 5.6.2, above, regarding soil, groundwater, surface water, and sediment interactions.

20. **Section 5.8.4 Recently Identified AOCs Not Previously Investigated** - It is stated on page B-5-57 that one additional AOC (debris areas) was identified the RI field activities. This is presented on Figure B-47. See comment for Section 5.6.4, above.

21. **Section 6.1.1 QA / QC** - It is stated on page B-6.1 that all proposed soil samples were collected during the RI with the exception of 20 samples that could not be collected due to refusal or lack of recovery. These missing soil samples are identified in Section 2.4.5, however specific information is lacking. Additional information must be provided regarding these missing samples including the AOC that each were to be located in and the significance of the missing data on AOC specific delineation. The proposed location of these missing samples must be shown on a site figure.

22. **Appendix E** - A review of the historic fill boring logs indicates that several test pits contained tar, sheen and/or other substances (described as "black sticky," "black shiny wax-like," "Vaseline-like," "black wax-like," "yellow wax-like," etc.) that may be considered product pursuant to N.J.A.C. 7:26E-2.1(a)11. Since the test pit locations are only provided in latitude/longitude, and not in site map grid coordinates, it is not possible to easily identify them on a site map. As such, it is unknown if soil or ground water contamination may be associated with the materials in these test pits. Furthermore, it does not appear that any proposal exists to address the materials encountered as required by N.J.A.C. 7:26E-6.1(d).

Specific Comments
Volume C – Groundwater

1. Well permits, well records and well certification Forms A and B were not submitted. Hercules shall provide all well information per N.J.A.C. 7:26E-4.8(c)6.

2. The RIR does not include the results of a well search pursuant to N.J.A.C. 7:26E-4.8(b)2ii. The well search shall be conducted per N.J.A.C. 7:26E-3.7(e)3i. Note that all available local and county records shall be reviewed in addition to NJDEP records.

3. It is noted that MW5P and MW22 are damaged. They shall be properly abandoned per N.J.A.C. 7:26E-4.4(g)11. Copies of the well abandonment reports shall be provided.

4. A review of the sampling logs and well records (accessed from the Bureau of Water Allocation) indicates discrepancies in well depths for numerous wells. For almost all of these wells, the depths reported on the sampling logs are shallower than those reported on the well records. This may be the result of siltation or the provision of incorrect well permit numbers. The permit numbers for OB1 and OB3, for example, appear to be reversed based on a well record review. Hercules shall ensure that the well permit numbers are correct and that the construction specifications reported on the well records are accurate. Any change in well information (e.g., depth, permit number, screened interval, etc.) must be documented in writing as required and provided in the RIR.

5. Location information included in future reports shall be provided in New Jersey State Plane Coordinates (NAD83) pursuant to N.J.A.C. 7:26E-3.13(c)3v(1).

6. A positive displacement pump is recommended for all future temporary well point sampling activities since the use of a peristaltic pump can result in a loss of VOCs. Such pumps are available in small diameters (i.e., <1 inch).

7. Future VOC and SVOC analyses shall include library searches for tentatively identified compounds (TICs).

8. **Section 2.3 Development of Monitoring Wells** - It is stated that the air-lift method of development was used at some wells. It is understood that this was discussed with the prior case manager. For future reference, however, this method shall not be used for development. Please refer to Sections 6.9.9.1 and 6.9.9.2 of the Field Sampling Procedures Manual (FSPM).

9. **Section 2.4 Monitoring Well Sampling** - It is stated that one ground water sample was collected at the depth of greatest potential contamination or mid-screen. A 10' screen was assumed for existing wells where documentation was unavailable. The collection of one sample does not comply with the Low-Flow Purging and Sampling (LFPS) requirements described in Section 6.9.2.2 of the FSPM. Samples are required

for each 5' of saturated screen. Many of the new wells have screens up to 20' long. In addition, contrary to Hercules' assumption, a well record review indicates that most of the referenced existing wells have 15-20' screens. In the future, Hercules shall use acceptable sampling methods pursuant to N.J.A.C. 7:26E-4.4(d), such as those included in the FSPM.

10. **Section 2.5 Synoptic Water Level Measurements** - It is stated that several points were not used since the data were considered anomalous. It is also stated that information that could be used to correct the data (construction details, valid survey) could not be located for OB3, MW9P and MW10. Records for these wells should be obtained during the required well search. All wells with uncertain survey information shall be re-surveyed.

11. **Section 2.8 Hydraulic Oil Pipeline Investigation** - Trench samples were subjected to BTEX, MTBE, PAH, PHC and fingerprint analyses. Per Table 2-1 of N.J.A.C. 7:26E et seq., VO+10 and BN+15 analyses are required for ground water samples where hydraulic oils are of concern. Hercules shall analyze the ground water samples for the required parameters per N.J.A.C. 7:26E- 2.1(d).

12. **Appendix D** - Many of the well logs contain incomplete information (e.g., no depth-to-water or flow rate data). In addition, well logs are not provided for MW7PD, 12D, 18D, 27D, 38, 38D, 39, 40, 41 and 41D. Hercules shall provide complete, accurate information per N.J.A.C. 7:26E-1.6(e), including the missing logs. Future logs shall contain complete information or notations as to why the information was not provided.

13. **Appendix E** - Hercules shall correct and provide the following: 1. The sampling logs for MW6P and MW7P have the same permit number. 2. Logs are provided for MW48 and MW48D, but data are not included on Tables C-11 or C-13. 3. Many of the SI sampling logs were incomplete and MW25 was purged dry. Hercules shall provide complete, accurate information per N.J.A.C. 7:26E-1.6(e), and shall ensure that all future logs are complete and accurate and that wells are properly purged and sampled.

14. **Appendix F** - A review of the data for several wells indicates a concave upward (or double straight line) effect. The first (early) segment is generally indicative of well storage (i.e., drainage from sand or gravel pack). Automated analysis procedures emphasize early data because most software programs perform the straight-line fit using the actual response data and not a logarithm of the data. It appears that this was the case with some of the data since the straight line in these situations was fit to the early portion of the data. Butler (1998) reports that, for the Bouwer-Rice method, a straight line should be fit to normalized response data in the range of 0.2 to 0.3. It must be clarified if the AQTESOLV program, used by Hercules, accounted for this and made the necessary corrections. If not, the data should be re-analyzed.

15. **Table C-14** - A review of Table C-14 indicates that the sample from GW-R-TR-01 was not analyzed for PHCs. This omission shall be clarified.

16. **Final Field Quality Assurance Project Plan (QAPP)** - It is stated in Section 9.3.1.1 of the Final Field QAPP (included as Appendix G in Volume A) that if a well is pumped at 0.5 gpm or less and purges dry, the well will be sampled upon recovery. Pursuant to Section 6.9.2.4 of the FSPM, purging a well to dryness is unacceptable. If excessive drawdown is noted, purging should cease before the water level reaches the pump. Sampling should then commence upon recovery. This procedure shall be observed in future sampling events.

17. **Revised Site-Wide RI Work Plan** - It is stated in Section 3.3.3 of the Revised Site-Wide RI Work Plan (included as Appendix I in Volume A) that the depth-to-water and depth-to-bottom will be measured prior to purging and sampling. This is acceptable only for standard purging and sampling procedures. For low-flow purging and sampling, the well depth should be measured after sampling or at least 48 hours prior to sampling per Section 6.9.2.2.5.9 of the FSPM.

Reference: Butler, J.J., Jr., 1998. *The Design, Performance, and Analysis of Slug Tests*, Lewis Publishers, New York, 252p.

Specific Comments
Volume D - Sediments

1. **Section 5.4 Western Drainage Area Analytical Results** - It is stated on page D-5-15 that SVOCs and metals detected at concentrations exceeding either the LEL or SEL at the Facility are comprised primarily of PAH constituents. These constituents are associated with the historically common practice of using fly ash as fill material (historic fill) to improve the grade of the Facility, recover unusable land, and establish numerous narrow gauge rail beds. As stated above in regard to the historic fill discussion, based on the site history, NJDEP does not agree that all elevated metals and PAHs in sediments are associated with historic fill. This may be a valid conclusion in a few unimpacted areas away from the site operations. However for the majority of the site, the data clearly shows elevated PAHs and metals that are related to operational areas of the site. This can be readily seen in the miscellaneous ponds and streams in the Central Drainage Area and Duck Pond and northwest Tributaries Drainage Area. The RIR must indicate that the data shows elevated PAHs and metals (especially lead and arsenic) in sediment samples, which are likely due to burning ground activities and site related operations and disposal activities. Sediment samples in the miscellaneous ponds in the Central Drainage Area had lead at concentrations as high as 148,000 mg/kg. Stream sediments in this area contained lead up to 6250 mg/kg. This same comment applies to Section 5.5, the Central Drainage Area, Section 5.6 Eastern Drainage Area, Section 5.7, Duck Pond and Tributaries, Section 5.8, Miscellaneous Ponds Analytical Results and Section 6, Conclusions on page D-6-2.

2. **Section 2.4 Laboratory Analysis** - The RI analyte list is based on contaminants identified during the SI where concentrations exceeded sediment screening criteria. If contaminants were detected in the SI, but screening criteria were not available, they were not analyzed in the RI. This is not acceptable pursuant to NJDEP and USEPA Region II policy. Detected contaminants lacking screening criteria must not be culled; these contaminants must be identified and carried throughout the RI and risks assessment processes (e.g. 5 of 10 explosive compounds and benzo(b)fluoranthene were detected in the SI and inappropriately culled from the RI). It must be clarified why benzo(b)fluoranthene does not appear in Table D-2.

3. **Section 2.4 Laboratory Analysis** - It must be clarified whether non-target compounds and TICs were quantified and are available as a component of the SI and RI data sets.

4. **Section 4.0 Drainage Area Description** - Miscellaneous Ponds: Hercules states that "the miscellaneous ponds are seasonally intermittent and can be dry during the summer months." Hercules should clarify which, if any, ponds function as vernal pools.

5. **Section 5.1.1 Sediment Quality Standards** - Since sediment benchmarks have not been promulgated, the term "standards" should be replaced with "screening criteria" in future reports.

6. **Section 5.1.1 Sediment Quality Standards** – First bullet: The term "NJDEP Freshwater Sediment Screening Guidelines LEL/SEL" should be replaced with the primary reference in future documents: "Persaud, D., Jaagumagi, R., and Hayton, A. 1993. *Guidelines for the protection and management of aquatic sediment quality in Ontario*. Ontario Ministry of the Environment, Ottawa, Ontario. 23p.

7. **Section 5.2 Frequency Exceedance Constituents** - This approach must be used with caution during RI data evaluation and remedial action selection, so as not to minimize concern for "hot spots,' where elevated individual non-FEC contaminants may be indicative of a source area. An example is elevated TNT in the Western Drainage Area where only 5 of 74 samples exceeded the LEL, the maximum concentration detected was 3 orders of magnitude above the LEL.

8. **Section 5.3 Organization of Results** - Figures: Hercules states that "Figure D-6 presents the composite site-wide areal extent of all analytical group exceedences with inferred horizontal extent of sediment contamination." Hercules must clarify whether further delineation is proposed and should provide a figure containing only site-related contaminants exceeding ecological screening criteria (ESC).

9. **Section 5.3 Organization of Results** - Hercules further states that "Samples SD-R-F14-02 … and SD-R-H11-04 were in error not selected for metals analysis." Hercules is required to provide delineation for the metals contamination in all areas.

10. **Section 5.4 Western Drainage Area Analytical Results** - Hercules states that "the removal of the impervious surfaces greatly increased the natural infiltration of precipitation, and therefore significantly reduced or eliminated surface water runoff in some areas, causing segments of former areas to become dry and no longer contain sediment." Hercules must also determine whether contaminants in these areas exceed soil ESC.

11. **Section 5.4.3 Metals** - Hercules states that "this stream enters the Facility at SD-R-E16-3-01/SD-R-E16-01 and represents contamination entering the Facility. The contamination is believed to be derived from surface water drainage originating from U.S. Highway Route 46." There is a clean sample immediately down gradient of this sample; therefore contaminants below this area cannot be attributed to off-site contamination.

12. **Section 5.5 Central Drainage Area Analytical Results** - Hercules states that "some areas identified in the SI with concentrations exceeding the LEL or SEL could not be sampled to define horizontal or vertical extent in the RI because the stream segment, pond, wet area, or former ditch no longer conveys water." Hercules must determine whether contaminants in these areas exceed soil SSC.

13. **Section 5.6 Eastern Drainage Area Analytical Results** – Please refer to comment for Section 5.5, above.

14. **Section 5.6.2 Metals** - Hercules states that "vertical delineation is defined in the southeastern portion of this area [SD-R-G12-11] by the physical boundary." Hercules should delineate the contamination in the other horizontal directions as well as vertically.
15. Hercules also states that "vertical delineation is defined in the northern and eastern portions of this area [SD-R-G12-01] by the physical boundary." Hercules should delineate the contamination in the other horizontal directions as well as vertically.
16. Hercules further states that "the southern horizontal limit of this stream segment has not been defined by the LEL and SEL compliance because this stream enters an underground culvert." Hercules should state whether the LEL and SEL are met at the point where the stream emerges from the culvert.

17. **Section 5.7.2 Metals** - Hercules states that the "vertical sample [SD-R-M7-01, SD-R-L5-01 and SD-R-L5-02] was collected at the same locations utilized for horizontal delineation." Hercules is advised that vertical delineation must be accomplished at the area of exceedence, not at an area of compliance. Therefore, this vertical delineation is not acceptable.

18. **Section 5.7.3 E&E** – Please refer to comment for Section 5.7.2, above.

19. **Section 5.8 Miscellaneous Ponds Analytical Results** – Pleaser refer to comments for Section 5.4, above.

20. **Section 5.8 Miscellaneous Ponds Analytical Results** – Hercules states that SVOCs are "constituents are associated with the historically common practice of using fly ash as fill material (historic fill)." If fly ash from the site was also used at the site, it may not be possible to determine which contaminants are associated with historic placement of fly ash and which are associated with site-related fly ash. The issue of historic fill material was discussed at length in a previous comment.

21. **Section 6.0 Conclusions** - The conclusions shall be modified to identify any data gaps, such as:

    - Dioxin/furan analysis at areas of historic burning ground operations
    - Delineation beyond established "horizontal limits," e.g. where flooding of streams or other water bodies may have caused contaminant migration beyond the banks
    - Data needs for analytes that were culled upon SI completion based on lack of screening criteria, as discussed above.

Specific Comments
Volume E – Surface Water

1. **Section 4.2 Surface Water/Groundwater Interaction** - Groundwater plume discharge zones to surface water and groundwater sample results need to be shown on figures along with the surface water system surface water, sediment and any ecological sample locations and results. This is needed to determine if groundwater contaminant impacts at the Duck Pond have been characterized. This information has not been pulled together in the figures, tables and data discussions of any of the reports and a comprehensive understanding of this part of the remedial investigation remains outstanding. Compound specific parameters (VOC, SVOC, explosives, and inorganic/general water quality parameters, including ammonia, total phosphorus, orth-phosphate, TDS and chloride) need to be evaluated in groundwater plume discharge zones at the Duck Pond. Additional investigation may be needed if parameters were not included, samples were in the wrong locations, etc. Temperature probes maybe an effective means to locate groundwater discharge points and some of the parameters of concern (e.g. explosives, VOCs) may be amenable to streambed sampling using passive diffusion bags.

2. **Section 5.2 Frequent Exceedence Constituents (FEC)** - Hercules states that "surface water FECs are defined for the purpose of this report as constituents with detected concentrations exceeding the SWQS at a frequency greater than 10% on a site-wide basis." Hercules is advised that contaminants must be considered on an area-specific basis as well. A concentration of exceedences in a certain area may be indicative of a point source release and must be addressed.

3. **Section 5.2 Frequent Exceedence Constituents (FEC)** - Hercules further states that dissolved metals and tetrachloroethene (PCE) were not selected as FECs based on the limited number of samples analyzed for these constituents. Hercules is advised that dissolved metals and PCE will need to be addressed on an area specific basis.

4. **Section 5.3 Organization of Results** - Hercules states that "horizontal limits of surface water exceedences are inferred to be half the distance between Surface Water Quality Standards (SWQS) exceedence points and compliance points." Hercules needs to delineate the exceedences to confirm the horizontal limits of surface water exceedences.

5. **Section 5.3 Organization of Results** - Hercules further states that "these are conservative assumptions that were used to graphically depict the data and the actual extent of constituents present may be less than shown." Hercules is advised that the actual extent of constituents present may be *more than shown* as well.

6. **Section 5.3 Organization of Results** - Figures: Hercules states that "groundwater sample locations with constituents detected at concentrations exceeding the Groundwater Quality Standards (GWQS) and associated with surface water exceedences are color-coded red and are bold." Hercules should compare

groundwater contaminants associated with surface water to the SWQS as well as the GWQS.

7. **Section 5.4 Western Drainage Area Analytical Results** - Hercules does not provide the depth at which the surface water samples were collected. If the contaminant source is groundwater or sediment, then Hercules should collect the surface water samples at a depth of 0"-6" above the sediment.

8. **Section 5.4.5 Western Drainage Area Summary** - Hercules states that "total metals concentrations detected above the SWQS are attributed to the presence of very fine sediments (silt sized and smaller) that have become suspended within the surface water column." If the metals are associated with the sediments at the site, then total metals must be considered during evaluation of environmental impacts.

Specific Comments
Additional Groundwater Remedial Investigation Sampling Report

1. **Section 2.1 Synoptic...Groundwater Elevations** - It is stated that the wells were field screened with a PID. Such readings are not, however, included in the sampling logs or any table. PID readings are required per N.J.A.C. 7:26E-3.13(c)7i(3).

2. **Section 2.2 Monitoring Well Sampling** - It is stated that MW11 was not sampled because it was sediment-laden. It shall be redeveloped (via pumping and surge block) per Sections 6.9.9.1 and A.6.1.5.1 of the Field Sampling Procedures Manual.

3. **Tables 1a and 2** - It is noted that the screened intervals for 35 wells are from historic logs that may or may not be accurate. Down-hole video was used at 6 other wells to determine construction. Hercules must confirm construction details for all wells.

4. **Appendix I** – The water level readings for MW4, MW7P and MW11 do not match those on Table 2 and shall be clarified.

5. **Tables** Contaminants were detected in the deepest samples at several monitor well and well point locations. Delineation (vertical) is therefore incomplete.

6. **Section 7.0 Recommendations** - DEP agrees that further off-site delineation is warranted in the southwest direction. Hercules must continue to address horizontal and vertical delineation per N.J.A.C. 7:26E-4.4(h)3i.

7. **Section 7.0 Recommendations** - The proposal for re-surveying several of the wells is acceptable. A revised Form B shall be provided for each well.

8. **Section 7.0 Recommendations** - MW5P and MW22 are still noted to be damaged. Proper abandonment was required, above. Hercules states that they will be abandoned. This is acceptable. Procedures shall comply with N.J.A.C. 7:9D-3. Copies of the well abandonment reports shall be provided.

Appendix B

Phase II RI Memorandum

TO:	Edward Meeks	**cc:**	Michael Kozar
FROM:	John Lucey		Mark Foley
RE:	Phase II Remedial Investigations		
FILE:	2420/46425		
DATE:	October 4, 2013		

INTRODUCTION

This memorandum has been prepared to document planned Phase II Remedial Investigations (RI) at Hercules Incorporated's (Hercules) Former Kenvil Works facility in Kenvil, New Jersey (the Site). These investigations will be conducted to delineate the extent of constituents detected a concentrations exceeding the applicable remediation standards in the various media present at the Site. This memorandum has been prepared in accordance with the scope of work detailed in Hercules's March 26, 2010 Request for bid and subsequent meetings between Hercules and O'Brien & Gere. O'Brien & Gere assumes the scope of work detailed below, the planned investigation methods, and subsequent reports will be reviewed by Hercules' Licensed Site Remediation Professional (LSRP).

The additional RI planned for Site will include the following:

- Groundwater Sampling
- Monitoring Well Installation
- Surface Water Sampling
- Sediment Sampling
- Soil Screening for Dioxins at Former Burning Grounds
- Down-Gradient (off-Site) Delineation of the TNT Area Groundwater Plume Using Waterloo Sampling Techniques
- Soil Sampling to Delineate the Extent of Constituents at Concentrations above applicable Standards

The remedial investigations will be conducted in accordance with the procedures detailed in the following New Jersey Department of Protection (NJDEP) approved documents prepared by MWH Americas, Inc. (MWH) on behalf of Hercules:

- 2005 Revised Field Quality Assurance Project Plan (FQAPP)
- 2006 Revised Site-Wide Remedial Investigation Work Plan (RIWP)

Additionally, laboratory analysis and sample handling will be conducted in accordance with 2013 *Quality Assurance Project Plan* (QAPP) prepared by O'Brien & Gere.

Sample locations were selected based on the data provided in the following reports and correspondence:

- Remedial Investigation Report Volume A - Summary (May 2007) by MWH
- Remedial Investigation Report Volume B - Soil - Text, Figures, Tables and Appendices (April 2007) by MWH
- Remedial Investigation Report Volume C - Groundwater - Text, Figures, Tables and Appendices (February 2007) by MWH
- Remedial Investigation Report Volume D - Sediment - Text, Figures, Tables and Appendices (December 2006) by MWH
- Remedial Investigation Report Volume E - Surfacewater - Text, Figures, Tables and Appendices (March 2007) by MWH
- Additional Groundwater Remedial Investigation Sampling Report (June 2009) by Environmental Alliance (EA)
- November 18, 2010 Letter from the NJDEP

PDF versions of these documents are provided on CD in Attachment 1

The following tables and figures detailing sampling locations and required laboratory analysis are provided:

Tables

Table 1 – Groundwater Screening Plan for E&E Compounds
Table 2 – Proposed Monitoring Well Construction Details
Table 3 - Surfacewater Sampling Plan
Table 4 - Sediment Sampling Plan
Table 5 – Groundwater Sampling Plan
Table 6 - Burning Grounds Soil Screening Plan
Table 7 – Off-Site TNT Groundwater Sampling Plan
Table 8 – Soil Sampling Plan

Figures

Figure 1 - Site Plan Showing Monitoring Well Locations
Figure 2 - Site Plan Showing Surface Water Sample Locations
Figure 3 - Site Plan Showing Sediment Sample Locations
Figure 4 - Site Plan Showing Burning Grounds Soil Boring Locations
Figure 5 - Off-Site TNT Groundwater Sampling Locations

Additional information provided in this memorandum include:

- Project organization/contact
- Procedures for equipment decontamination
- Sample handling and field custody procedures
- Field logbook procedures

PROJECT ORGANIZATION/CONTACT INFORMATION

O'Brien & Gere will be responsible for project management, sample collection, data reduction and reporting. LSRP services will be provided by WSP Environment & Energy. The LSRP will oversee and approve the development of work plan related documents and the Remedial Investigation Report. Responsibilities for key project team members are summarized below.

Regulatory Agency and Client Key Personnel

An independent LSRP, contracted by Hercules, has oversight authority on behalf of Hercules for corresponding with NJDEP.

The LSRP contact information is as follows:

Mark Foley -LSRP
Senior Project Director
WSP Environment & Energy
200 Cottontail Lane, Suite A112W
Somerset, NJ 08873
mark.foley@wspgroup.com
(732) 564-0888 ext. 16 - Office

Hercules Representative

Mr. Edward Meeks is the primary contacts at Hercules and is responsible for the execution of each phase of the project, including any correspondence and coordinating activities with NJDEP.

Hercules's contact information is as follows:

Edward Meeks - Project Manager
Remediation Project Manager
500 Hercules Road
Building 8139/130
Wilmington, DE 19808-1599
edmeeks@ashland.com
(302) 995-3433 – Office

O'Brien & Gere Key Personnel

O'Brien & Gere Project Officer

Mike Kozar, P.G. is the O'Brien & Gere Project Officer and has overall responsibility for meeting the stated project objectives. In addition, he is responsible for providing the O'Brien & Gere Project Manager with access to O'Brien & Gere corporate resources.

The O'Brien & Gere Project Officer contact information is as follows:

Michael Kozar – Vice President
O'Brien & Gere Project Officer
Bentwood Campus

301 East Germantown Pike/3rd floor
East Norriton, PA 19401
Michael.Kozar@obg.com
(484) 804-7212 – Office

O'Brien & Gere Project Manager

John Lucey, P.G. is the O'Brien & Gere Project Manager and is responsible for implementing the project and has the authority to commit the resources necessary to meet project objectives and requirements. His primary function is to meet the technical, financial, and scheduling objectives and will provide direction to O'Brien & Gere Project Team.

The O'Brien & Gere Project Manager contact information is as follows:

John Lucey –Project Associate
O'Brien & Gere Project Manager
200 Biddle Avenue
Suite 203
Newark, DE 19702
John.Lucey@obg.com
(302) 804-7212 – Office

O'Brien & Gere QA Officer

Karen Storne is the O'Brien & Gere QA Officer (QAO) for this project. She will manage and be responsible for QA/QC review of data generated during the sample collection activities. If QA problems or deficiencies requiring special action are identified, the O'Brien & Gere QAO, Project Manager, and Project Officer will determine the appropriate corrective action. The QAO will then be responsible for follow-up and oversight of corrective action implementation, to the satisfaction of Hercules and the NJDEP representative.

The O'Brien & QA Officer contact information is as follows:

Karen Storne–Technical Associate
O'Brien & Gere QA Officer
333 West Washington Street
Syracuse, NY 13202
Karen.Storne@obg.com
(315) 662-3458

O'Brien & Gere Field Investigation Manager

The O'Brien & Gere Field Investigation Manager will be responsible for directing and coordinating the day-to-day activities while field activities are underway.

O'Brien & Gere Field Sampling Personnel

O'Brien & Gere field sampling personnel will be responsible for collection, packaging, preservation, and shipping of environmental samples in accordance with the QAPP and applicable NJDEP requirements. Field sampling personnel will also collect field data and monitor Site health and safety.

Health and Safety Coordinator

Karin Robachefski, CHST, OHST is the O'Brien & Gere Health & Safety Coordinator and will be responsible for monitoring Site health and safety during the sampling events.

The O'Brien & Gere Health and Safety Coordinator contact information is as follows:

Karin Robachefski
Health & Safety Specialist
1090 King Georges Post Road
Suite 904
Edison, NJ 08837
Karin.Robachefski@obg.com
732-638-2943

Laboratory Management

Eurofins Lancaster Laboratories of Lancaster, Pennsylvania will analyze samples collected during the sampling activities. The laboratory contact information is as follows:

Eurofins Lancaster Laboratories
2425 New Holland Pike
Lancaster, Pennsylvania 17601
717-656-2300

Laboratory Project Manager

Wendy Kozma is the Laboratory Project Manager for Eurofins Lancaster Laboratories and will be responsible for:

- Coordinating sample bottle delivery and sample pickups from the Site
- Supervising the in-house chain-of-custodies.
- Scheduling sample analysis.
- Overseeing data review.
- Overseeing preparation of analytical reports.

It will be the responsibility of the Lancaster Laboratory Project Manager to approve final analytical reports prior to submission to O'Brien & Gere.

Monitoring Well Installation

Drilling Services

Drilling services will be provided by Summit Drilling Co., Inc. The drilling services will include monitoring well installation, monitoring well development, soil boring installation, management of investigation derived waste, monitoring well permitting, and preparation of monitoring well Forms A.

Summit Drilling Co., Inc contact information is as follows:

David Adams
Project Manager
81 Chimney Rock Road
Bridgewater, NJ 08807
908-722-4266

Surveying Services

Surveying services will be provided by Vargo Associates. The surveying services will include surveying locations and elevations of newly installed monitoring wells, soil borings, dioxin screening locations, and Waterloo sampling locations. The surveyor will prepare monitoring well Forms B and provide the elevation and location data in electronic format (MS Excel).

Vargo Associates contact information is as follows:

Mike Vargo
Vargo Associates Surveying Manager
2771 Delsea Drive, Franklinville, NJ 08322
Franklinville, NJ 08322
(856) 694-1716

REMEDIAL INVESTIGATION ACTIVITIES

Task 1 - Groundwater E&E Screening

Groundwater sampling results from 2006 and 2008 indicated the cyclotrimethylenetrinitramine (RDX) plume has migrated approximately 500 feet in two years. To accurately locate the leading edge of the RDX plume, 16 monitoring wells (MW-15 through MW-18, MW-23, MW-25, MW-33 through MW-37, MW-41, and MW-J2 through MW-J5) will be sampled for explosive and energetic (E&E) compounds (see Table 1) prior to installing monitoring wells MW-52 and MD-52D, which are intended to monitor the downgradient edge of the RDX plume. The groundwater E&E screening activities will be conducted prior to mobilizing to the Site to for monitoring well installation.

Purging and Sampling Methods

Prior to commencing well purging and groundwater sample collection, the depth to groundwater and depth to bottom of each monitoring well in the vicinity of the RDX plume will be obtained and recorded. These measurements will be used to calculate monitoring well purge volumes and groundwater flow in the vicinity of the RDX plume. The depth to water will be measured in each well by slowly lowering a decontaminated electronic water level meter to the nearest 0.01 foot and will be recorded in the field notebook.

The monitoring wells will be purged and sampled using conventional groundwater sampling techniques. The monitoring well purging activities will be accomplished by removing three casing volumes of water with a submersible electric pump with new dedicated polyethylene discharge tubing. Pumping rates will be kept as low as is reasonably (See well sampling data forms in MHW's *RI Report Volume C*) to avoid pumping the well dry. If the well is pumped at a rate of 0.5 gallons per minute (gpm) or less and purged dry, no additional purging will be considered necessary and the well will be allowed to recover until a sufficient quantity of water is present in the well to collect the groundwater sample. Purge water will be discharged to the ground surface down gradient of the well. The field parameters pH, specific conductance, temperature, dissolved oxygen, oxidation reduction potential, and turbidity will be measured at the start of the purge, after each well volume has been removed and at the time of sampling. After each well is purged a groundwater sample will be collected with a dedicated, disposable Teflon® bailer.

Field procedures, including groundwater depth measurements (for elevation calculations and purge volume calculations), monitoring well purging and field testing of groundwater quality (including pH, specific conductance, temperature, dissolved oxygen, oxidation reduction potential, and turbidity), decontamination of purging and sampling equipment and groundwater sampling, will be conducted in accordance with the procedures detailed in the FQAPP.

Laboratory Analysis

The groundwater and associated quality control samples generated will be submitted to Eurofins Lancaster Laboratories, a New Jersey certified laboratory, for analysis. The samples will be analyzed for E&E compounds, as indicated in Table 1.

Sample bottle requirements and preservation methods are detailed in Table 1 of the QAPP.

QA/QC samples that will be collected as part of the E&E screening program will include the following:

- One duplicate sample per each 10 field samples
- One field blank per each 10 field samples
- One MS/MSD sample per sample delivery group

Task 2 - Monitoring Well Installation

O'Brien & Gere will install ten (10) additional unconsolidated monitoring wells to complete the delineation of constituents of concern (COCs) in groundwater. The monitoring wells will be used to evaluate groundwater quality along the eastern edge of B-Line, delineate the southern extent of the TNT plume at the site boundary, delineate the depth of groundwater impact in the TNT Area groundwater plume, and evaluate groundwater quality downgradient of the RDX plume. Proposed monitoring well locations are indicated on Figure 1.

The rational for the installation of each well, anticipated well depths, and selected drilling methods are provided in Table 2. The locations for monitoring wells MW-52 and MD-52D, which are intended to monitor the downgradient edge of the RDX plume, may change based on the results of the E&E groundwater screening activities described above. Monitoring well installation, development, and surveying activities are summarized below.

Preparatory Activities

A minimum of three weeks prior to the installation of the monitoring wells, the selected driller will submit monitoring permits to the NJDEP. The driller will notify New Jersey One Call of the planned drilling activities, a minimum of 72 hours prior to drilling, to obtain a utility mark out. Monitoring wells locations will be cleared by Hercules, prior to mobilization of the drill rig.

Monitoring Well Installation Activities

The monitoring wells will be installed using either hollow stem auger (shallow wells) or mud rotary (deep wells) drilling techniques. Continuous split spoon samples will be collected during the installation of the pilot boring at each monitoring well location. The split spoon samples will be screened by an O'Brien & Gere geologist using a photo ionization detector (PID). The O'Brien & Gere geologist will also describe the soil cuttings using the *Burmeister Soil Classification* System. Soil cuttings generated during the well installation process will be spread across the ground surface, in proximity to the well. Standard Operating Procedures for monitoring well installation are provided in the February 2006 FQAPP prepared by MWH.

The monitoring wells will be constructed using Schedule 40 PVC casing and 0.010-inch, slotted PVC well screen, in accordance with the specifications provided in Table 2. Screen zone length will not exceed 10 feet. Morie No. 0 gravel pack will be placed from the bottom of the boring to five feet above the top of the screen zone. The remainder of the annular space will be tremie grouted using a cement-bentonite grout. The monitoring well installations will be completed with locking, steel casings. Detailed monitoring well installation procedures are provided in Section 3.3.1 of the RIWP.

After monitoring well activities have been completed, the driller will prepare Monitoring Well Forms A for the newly installed wells.

Monitoring Well Development

The monitoring wells will be developed using pumping and surging techniques until the discharge is clear. Water quality parameters (pH, conductivity, temperature, dissolved oxygen, and turbidity) along with the discharge rate will be measured periodically during the development process and recorded in the field

notebook. Well development water will be discharged to the ground surface down gradient from the well head. Detailed monitoring well development procedures are provided in Section 3.3.2 of the RIWP.

Monitoring Well Surveying

A New Jersey licensed surveyor will establish the horizontal location and elevation of the newly installed wells. Horizontal control will be established to the nearest 0.1 ft and referenced to the New Jersey State Plane Coordinate system (NAD 83). Vertical control will be established to the nearest 0.01 ft and referenced to the NGVD 1929. The surveyor will prepare Monitoring Well Forms B for the newly surveyed wells.

Task 3 - Surface Water Sampling

The surface water sample collection program will include the collection of 25 surface water samples to evaluate surface water outside defined channels, confirm surface water quality exiting site, and to evaluate dissolved constituents present in surface water adjacent to Duck Pond. The surface water sample locations are indicated on Figure 2. Analytical parameters and rationale for the collection of the surface water samples are provided on Table 3. Surface water sampling procedures are summarized below.

Surface water samples will be collected from the Eastern, Central and Western Drainage Areas and Tributaries to Duck Pond by walking into the selected areas (downstream to upstream), as water depths in these areas are typically less than two feet. The collection of surface water samples from Duck Pond may require the use of a boat as water depths can be in excess of four feet.

Surface Water Sampling Access

Access to surface water sampling locations can be achieved by utilizing a small raft or boat (to be provided by Hercules), a temporary bridge placed over narrow stream channels, and hip waders in shallow wetland areas.

Surface Water Sampling Methods

Two types of surface water sampling will be conducted (discrete depth sampling and surface sampling). Discrete depth sampling will be conducted at one location (See Location F on Table 3 and Figure 2). Surface sampling will be conducted in shallower water bodies such as the southern wetlands. The surface water sampling procedures are summarized below.

Discrete Depth Sampling

Discrete depth samples will be collected with a weighted bottle sampler. The weighted bottle sampler consists of a glass bottle equipped with a stopper that can be remotely removed from the surface, and weights to carry the bottle to the desired sampling depth. The discrete depth surface water sampling activities will be conducted in accordance with the procedures summarized below:

- The weighted bottle sampler will be lowered to the desired sampling depth
- The stopper will be removed from the bottle to allow it to fill with water
- The stopper is replaced in the bottle
- The sampler is retrieved and the collected sample is transferred to laboratory provided sample containers

Detailed discrete depth surface water sampling procedures are provided in Section 10.1 of the FQAPP.

Shallow Surface Water Sampling

Shallow surface water samples will be collected using a dip sampler. Deeper, discrete depth, surface water samples (greater than one foot) will be collected using a weighted bottle sampler. Shallow surface water samples will be collected by slowly submerging a laboratory-provided glass sample bottle horizontally into the water at the designated sample collection point. The bottle will be gradually turned upright, keeping the lip just under the surface so that only surface water is collected. Care will be taken to minimize surface disturbance throughout the sampling process. If the water is not deep enough to turn the bottle upright, the bottle will be held at an angle as steep as possible with the lip remaining just under the surface. In the event field personnel cannot easily access the sampling point or disturbance of the sediment is expected, the glass sample collection container will be attached to a pole of sufficient length to reach the sampling point.

Detailed surface water sampling procedures are provided in Section 10.2 of the FQAPP

Co-Located Samples

When surface water and sediment samples are taken at the same locations, the surface water sample will be collected first to minimize turbidity and reduce the potential of contaminating the surface water sample with disturbed sediment. Where samples are collected at multiple depth intervals, the samples will be collected in descending order from shallowest to deepest. In addition, down-stream samples will be collected prior to up-stream samples.

Laboratory Analysis

The surface water and associated quality control samples generated will be submitted to Eurofins Lancaster Laboratories, a New Jersey certified laboratory, for analysis. The samples will be analyzed for the following parameter, as indicated in Table 3:

- Semi-volatile organic compounds (SVOCs)
- E&E Compounds
- Target Analyte List (TAL) Metals
- Hardness
- pH

Sample bottle requirements and preservation methods are detailed in Table 1 of the QAPP.

QA/QC samples that will be collected as part of the surface water sampling program will include the following:

- One duplicate sample per each 20 field samples
- One field blank per each 10 field samples but no more than one per day
- One MS/MSD sample per sample delivery group

Surface Water Sampling Point Documentation

Surface water sampling locations will be documented using GPS methodologies. After each surface water sample has been collected horizontal location will be established and referenced to the New Jersey State Plane Coordinate system (NAD 83). Horizontal coordinates will be recorded in the field book.

Task 4 - Sediment Sampling

The sediment sample collection program will include the collection of 25 sediment samples to confirm depth of constituents at concentrations above applicable standards, confirm sediment quality adjacent to site outfall, and evaluate sediment quality outside defined channels within wetland areas. The sediment samples with be collected from the streams, wetlands and ponds present at the Site. The sediment sample locations are indicated on Figure 4. Analytical parameters and rationale for the collection of the sediment samples are provided on Table 4.

Sediment samples will be collected from the Eastern, Central and Western Drainage Areas and Tributaries to Duck Pond by walking into the selected areas (downstream to upstream) as water depths in these areas are typically less than two feet. The collection of sediment samples from Duck Pond may require the use of a boat as water depths can be in excess of four feet. Sediment sampling procedures are summarized below.

Sediment Sampling Access

Access to sediment sampling locations can be achieved by utilizing a small raft or boat (to be provided by Hercules), a temporary bridge placed over narrow stream channels, and hip waders in shallow wetland areas.

Sediment Sample Collection Methods

Sediment samples will be collected using one of two sampling devices. The two sediment sampling techniques involve the soil coring device/bucket auger (cohesive/compact sediments) and the silver bullet sampler (liquefied sediments). The soil coring device/bucket auger and silver bullet sampling procedures are described below.

Soil Coring Device/Bucket Auger

Shallow sediment samples can be collected with a bucket auger, provided the sediment is sufficiently cohesive or competent to be held within the bucket auger without losing the fine grained components of the sediment. The soil bucket auger will be advanced by hand at each sampling location for classification and sample collection. The bucket auger will be advanced at 6-inch intervals and then removed from the borehole for evaluation. Sediment sample collection procedures using a bucket auger are summarized below:

- Sample intervals will be selected for analyses as specified in Table 4.
- The bucket auger will be advanced to the desired depth and removed for sediment classification and sample collection.
- The sample material collected will be placed into a decontaminated stainless steel bowl and homogenized.
- Sample material will be transferred from the stainless steel bowl to the laboratory-supplied sample containers

Detailed procedures for collecting sediment samples using a bucket auger are provided in Section 8.2.1 of the FQAPP.

Silver Bullet Sampler

The silver bullet sampler is an aluminum alloy cylinder into which a laboratory provided clean glass collection tube is inserted. The silver bullet sampler is generally utilized to collect samples of liquefied sediments. The top of the sampler is equipped with a T-handle which is used to push the sampler to the desired depth within the sediment. Once the desired sampling depth is reached, the sampler is rotated 360° counter clockwise filling the collection jar with sediment. After the silver bullet sampler is retrieved, sediment samples will be collected in the following manner:

- The contents of the silver bullet sampler will then be emptied into a decontaminated stainless steel bowl and homogenized.
- Sample material for non-VOC analysis will transferred from the stainless steel bowl to the laboratory-supplied sample containers

Detailed procedures for collecting sediment samples using a silver bullet sampler are provided in Section 8.2.2 of the FQAPP.

Co-Located Samples

When surface water and sediment samples are taken at the same locations, the surface water sample will be collected first to minimize turbidity and reduce the potential of contaminating the surface water sample with disturbed sediment. Where sediment samples are collected at multiple depth intervals, the sediment samples will be collected in descending order from shallowest to deepest. In addition, sediment samples from down-stream locations will be collected prior to those from up-stream locations.

Laboratory Analysis

The sediment and associated quality control samples generated will be submitted to Eurofins Lancaster Laboratories, a New Jersey certified laboratory, for analysis. The samples will be analyzed for the following parameter, as indicated in Table 4:

- Polynuclear aromatic hydrocarbons (PAHs)
- E&E Compounds
- TAL Metals
- Moisture
- Percent solids
- Total organic carbons (TOC)

Sample bottle requirements and preservation methods are detailed in Table 1 of the QAPP.

QA/QC samples that will be collected as part of the sediment sampling program will include the following:

- One duplicate sample per each 20 field samples
- One field blank per each 10 field samples but no more than one per day
- One MS/MSD sample per sample delivery group

E&E Screening

Prior to shipping sediment samples to the laboratory, the samples will be screened for E&E compounds. If the screening indicates E&E compounds are not present, the sediments will shipped to the laboratory. Field screening for E&E compounds will be conducted in accordance with Section 5.1 of the FQAPP. E&E field screening kits will be provided by Hercules.

Sediment Sampling Point Documentation

Sediment sampling points will be documented using GPS methodologies. After each sediment sample has been collected horizontal location will be established and referenced to the New Jersey State Plane Coordinate system (NAD 83). Horizontal coordinates will be recorded in the field book.

Task 5 - Groundwater Sampling

At least two weeks after the new monitoring wells have been developed; O'Brien & Gere will collect groundwater samples from the 10 newly-installed monitoring wells (MW-43D, MW-49, MW-49D, MW-50, MW-50D, MW-51, MW-52, MW-52D, MW-53, and MW-53D) using low-flow sampling techniques. One groundwater sample will be collected from each wetted 5-foot section of screen length (i.e., two samples per well), consistent with NJDEP policy. The samples will be analyzed for VOCs, SVOCs, TAL metals, and E&E compounds. The groundwater samples will be collected to delineate the extent of COCs in groundwater

The *Additional GW-RI Report* (June 2009) prepared by Environmental Alliance identified 17 monitoring wells with lead present in groundwater samples at concentrations exceeding the NJDEP Class IIA GWQC. The previous groundwater sampling activities at the Site only identified two monitoring wells with lead present in the samples at concentrations exceeding the Class IIA GWQC. To further evaluate lead concentrations at these locations additional groundwater samples will be collected from the following 17 monitoring wells using low-flow sampling techniques: (MW-3A , MW-5, MW-7PD, MW-10, MW-12, MW-12D, MW-16, MW-21, MW-26D, MW-34, MW-37, MW-40, MW-44, MW-44D, MW-47, MW-J1D, and MW-J2).

The analytical parameters for the groundwater samples and pump depth settings are provided on Table 5. Monitoring well locations are indicated on Figure 1. Groundwater sampling procedures are summarized below.

Well Purging Methodology

Groundwater sampling will be conducted in accordance with the low-flow sampling procedures detailed in the February FQAPP prepared by MWH, as modified below. Each well will be purged minimum of two hours to reduce turbidity. A Grundfos® 2-inch diameter adjustable speed submersible pump and new, dedicated tubing Teflon®-lined tubing will be used to purge each monitoring well prior to sampling. The pump will be lowered into the well until the pump intake is at the required sampling interval (see above tables). The wells will be pumped at a rate to prevent drawdown from exceeding 0.3 feet (less than 0.5 L/min). Discharge from the pump will be diverted to a flow-through cell with a multi-meter probe capable of measuring pH, temperature, conductivity, dissolved oxygen (DO), oxidation-reduction potential and (ORP. Turbidity will be measured using a separate meter external to the flow-through cell. Stabilization parameters are as follow:

- ± 0.1 pH units
- ± 3 percent for temperature
- ± 3 percent for conductivity
- ± 10 percent for dissolved oxygen
- ± 10 millivolts (mV) for ORP

- ± 10 percent for turbidity, with the maximum turbidity less than 40 Nephelometric Turbidity Units
- <0.3 feet of water level drawdown

If these parameters have not stabilized after two hours, the LSRP will be notified. Based on information provided by O'Brien & Gere, the LSRP will decide which of the following three options should be considered:

- Continue purging in an attempt to achieve stabilization
- Discontinue purging, do not collect samples, and document attempts to reach stabilization in the log book
- Discontinue purging, collect samples, and document attempts to reach stabilization in the log book

For wells with two sampling intervals, the sample from the upper interval will be collected first. After that sample has been collected, the pump will be lowered to second sample interval and purging will commence. Pumps will be decontaminated between wells in accordance with the procedures detailed in the FQAPP.

Laboratory Analysis

Groundwater samples for newly installed monitoring well will be analyzed for the following parameters:

- VOCs
- SVOCs
- E&E compounds
- TAL Metals

Groundwater samples to be collected from existing monitoring wells will be analyzed for total and dissolved lead. The analytical parameters for the groundwater are summarized in Table 5. Following stabilization of water-quality parameters, as described above, the discharge from the well pump will be removed from the flow-through cell. At this point, the pumping rate and depth to water will be measured to ensure that a rate increase has not occurred due to the drop in hydraulic head associated with the closed flow-through cell. If necessary, the pumping rate will be reduced to match the purge rate.

Groundwater samples will be collected in appropriate sample containers as listed in QAPP. Sample bottles will be filled from each monitoring well in the following order:

- VOCs
- SVOCs
- E&E Compounds
- TAL Metals

Sample bottle requirements and preservation methods are detailed in Table 1 of the QAPP.

QA/QC samples that will be collected as part of the groundwater sampling program will include the following:

- One trip blank sample per sample shipment that require analysis for VOCs
- One duplicate sample per each 20 field samples
- One field blank per each 10 field samples but no more than one per day
- One MS/MSD sample per sample delivery group

Task 6 - Soil Sampling At Open Burning Grounds

O'Brien & Gere will collect 20 soil samples from around four former open burning grounds present at the Site to screen for the presence of dioxins and furans. These samples were requested by the NJDEP to evaluate if dioxin and furan compounds are present around the former burning grounds. The former open burning ground soil sample locations are indicated on Figure 4. Sampling depth and analytical methods are provided on Table 6. Soil sampling procedures are summarized below.

Soil Sampling

An O'Brien & Gere geologist will collect these dioxin/furan screening samples from shallow soil borings installed using direct push techniques. One soil sample will be collected from each soil boring biased to depth based on the presence of visible ash and analyzed for dioxins and furans. If ash is not observed, a soil sample will be collected from 0 to 0.5 foot below ground surface.

Soil borings will be backfilled to grade with original cuttings. After abandonment, a stake will be driven at each soil sample location.

Laboratory Analysis

The soil and associated quality control samples generated will be submitted to Eurofins Lancaster Laboratories, a New Jersey certified laboratory, for analysis. The samples will be analyzed for dioxins and dibenzofurans as indicated in Table 6.

Sample bottle requirements and preservation methods are detailed in Table 1 of the QAPP.

QA/QC samples that will be collected as part of the soil sampling program will include the following:

- One duplicate sample per each 20 field samples
- One field blank per each 10 field samples but no more than one per day
- One MS/MSD sample per sample delivery group

E&E Screening

Prior to shipping of the soil samples to the laboratory, the samples will be screened for E&E compounds. If the screening indicates concentrated E&E compounds (greater than 10%) are not present, the sediments will shipped to the laboratory. Field screening for E&E compounds will be conducted in accordance with Section 5.1 of the FQAPP.

Burning Ground Sampling Point Documentation

The locations of the Burning Ground soil boring locations will be established using a hand held GPS unit with sub-meter accuracy. Horizontal control will be referenced to the New Jersey State Plane Coordinate system (NAD 83). Vertical control will be referenced to the NGVD 1929.

Task 7 - Down-Gradient Delineation of the TNT Area Groundwater Plume

To define the maximum extent of trinitrotoluene (TNT) and its degradation products, 2-amino-4,6-dinitrotoluene (2A-DNT) and 4-amino-2,6-dinitrotoluene (4A-DNT) in groundwater, O'Brien & Gere will supervise the collection of downgradient groundwater samples from six off-Site boring locations. These

samples will be collected from soil borings installed on private (commercial) properties located southwest of the Site. The groundwater samples will be collected using a Waterloo Profiler ™ operated by Stone Environmental. O'Brien & Gere will supervise the drilling and collection of down-gradient groundwater samples. The Waterloo sample locations are indicated on the aerial photograph provided as Figure 5. Sampling depth and analytical methods are provided on Table 7. Waterloo sampling procedures are described below.

Waterloo Sampling Procedures

Groundwater samples will be collected using a modified Waterloo Profiler™ in accordance with procedures detailed in the NJDEP's 1994 *Alternative Ground Water Sampling Techniques Guide and* in the Stone SOP provided in Exhibit 2 of the QAPP. The Waterloo Profiler™ consists of a probe containing integrated sensors and sampling ports that is driven into the subsurface using direct push techniques. The integrated sensors are capable of measuring the hydraulic conductivity of the formation, hydraulic head, and physiochemical properties (pH, specific conductance, DO, and ORP). The Waterloo Profiler™ will be used to collect real time hydrostratigraphic data which will be used to ensure samples are being collected from sandy intervals. After the sampling interval is selected, the interval will be purged using an internal nitrogen gas drive pump. Physiochemical properties will be measured during the purging process to ensure formation stability prior to collecting a groundwater sample. A Geoprobe™ 66235 CPT direct push rig will be used to advance a modified Waterloo Profiler™ with minimal disturbance (i.e. minimal use of the hydraulic hammer imparting energy into the subsurface).

Groundwater samples will be collected by the modified Waterloo Profiler™ from the following discrete intervals at each location:

- 15 ft bgs,
- 30 ft bgs,
- 60 ft bgs,
- 90 ft bgs,
- 120 ft bgs.

Sampling depths may be adjusted based on hydrostratigraphic information obtained during boring installation.

Preparatory Activities

A minimum of three weeks prior to the Waterloo Profiling activities, the selected driller will submit soil boring permits to the NJDEP. The driller will notify New Jersey One Call of the planned drilling activities, a minimum of 72 hours prior to drilling, to obtain a utility mark out. Waterloo Profiling locations will be cleared by Hercules, prior to mobilization of the drill rig, to ensure drill rig access.

Laboratory Analysis

The groundwater and associated quality control samples generated will be submitted to Eurofins Lancaster Laboratories, a New Jersey certified laboratory, for analysis. The samples will be analyzed for E&E compounds as indicated on Table 7.

Sample bottle requirements and preservation methods are detailed in Table 1 of the QAPP.

QA/QC samples that will be collected as part of the off-Site groundwater sampling program will include the following:

- One duplicate sample per each 20 field samples
- One field blank per each 10 field samples but no more than one per day
- One matrix spike (MS) and one matrix spike duplicate (MSD) sample per sample delivery group

Waterloo Sampling Point Documentation

The locations of the Waterloo sample points will be established using a hand held GPS unit with sub-meter accuracy. Horizontal control will be referenced to the New Jersey State Plane Coordinate system (NAD 83). Vertical control will be referenced to the NGVD 1929.

Task 8 - Soil Sampling

Soil sampling will be conducted to delineate the vertical extent of constituents at concentrations above applicable standards, delineate the outbound extent of constituents at concentrations above applicable standards, and refine the extent of constituents at concentrations above applicable standards between individual AOCs. A total of 76 soil samples will be collected from a series of 38 soil borings. The soil borings will be installed by a New Jersey-licensed driller. The soil sample locations are indicated on Figure 4. Analytical parameter, sample depths and the rationale for the collection of the soil samples are provided on Table 8. Soil sampling procedures are summarized below.

Soil Sampling

Soil cores will be collected using a combination of hand auger and direct push (Geoprobe ™) sampling methods. Direct push soil sampling methods utilize a hydraulic hammer mounted on a truck or an all terrain vehicle to advance sampling devices into the subsurface. Soil samples collected using direct push methods will be obtained using the Macro Core (MC) sampling system. The MC sampling system consists of an open, steel tube that houses an acetate liner. The liner is held in place with a drive cap at the top and a cutting shoe at the bottom and is designed for continuous soil sample collection. If probe hole "cave-in" is significant, it may be necessary to use a closed piston assembly that fits into the MC. The closed piston assembly MC sampler remains completely closed when driven to depth and are opened by releasing a stop pin from the surface. Releasing the stop pin allows a piston to retract inside of the sample tube as it is being displaced by the sample core. The anticipated maximum depth of the soil borings is 10 feet. Direct push sampling procedures are detailed in Section 7.3.2 of the FQAPP.

After the MC sampler is retrieved, the liner will be removed and cut open to allow access to the soil core for field screening and sample collection. The soil core will be screened with a photoionization detector and logged by a geologist using the using the *Burmeister Soil Classification System*. Field screening procedures are detailed in Section 5.2 of the FQAPP.

Two soil samples will be collected from each soil boring. One soil sample will be collected from the 0 to 0.5 foot interval below the ground surface or the concrete, asphalt, or crushed stone, if the area is paved. The second sample will be taken from one of the following intervals:

- Sample depths will be biased based on visual observations and field screening with a PID
- The six-inch interval above the water table if no anthropogenic feature warranting biasing (e.g. stained soil, ash, etc.) is observed
- The base (9.5 to 10 ft bg interval) of the boring if no anthropogenic feature warranting biasing is observed and the water table is not encountered

Soil samples that will be analyzed for VOCs will be collected directly from the soil core using an Encore sampler. After the VOC sample is collected, the remaining portion of the selected sampling interval will be placed into a

decontaminated stainless steel bowl and homogenized. The soils will then be transferred from the bowl to the appropriate sample containers.

Soil borings will be backfilled to grade with original cuttings. If the soil boring extends below the water table, the portion of the soil boring below the water table will be sealed with a bentonite slurry. After abandonment, a stake will be driven at each soil sample location for later use by a New Jersey-licensed surveyor.

Laboratory Analysis

The soil and associated quality control samples generated will be submitted to Eurofins Lancaster Laboratories, a New Jersey certified laboratory, for analysis. The samples will be analyzed for VOCs, SVOCs, E&E Compounds, TAL Metals as indicated on Table 8.

Sample bottle requirements and preservation methods are detailed in Table 1 of the QAPP.

QA/QC samples that will be collected as part of the soil sampling program will include the following:

- One trip blank sample per sample shipment that requires analysis for VOCs
- One duplicate sample per each 20 field samples
- One field blank per each 10 field samples but no more than one per day
- One MS/MSD sample per sample delivery group

E&E Screening

Prior to shipping soil samples to the laboratory, the soil samples will be screened for E&E compounds. If the screening indicates significant E&E compounds are not present (greater than 10%), the sediments will shipped to the laboratory. Field screening for E&E compounds will be conducted in accordance with Section 5.1 of the FQAPP.

Soil Sampling Point Documentation

The locations of the soil borings points will be established using a hand held GPS unit with sub-meter accuracy. Horizontal control will be referenced to the New Jersey State Plane Coordinate system (NAD 83). Vertical control will be referenced to the NGVD 1929.

EQUIPMENT DECONTAMINATION PROCEDURES

All non-disposable equipment used in field sampling activities will be decontaminated before and after use. Dedicated, disposable equipment used for aqueous sampling will be decontaminated by the manufacturer. The Field Investigation Manager will ensure that appropriate decontamination procedures are followed.

Drill Rig

The drill rig and associated sampling equipment (i.e., augers, drill rods, etc.) will be decontaminated prior to arrival at the site and between at each monitoring well location prior to mobilization to the next monitoring drilling site. Decontamination of this equipment will be performed at a centralized decontamination pad. The following procedures will be used to decontaminate the drill rig and associated sampling equipment:

- The drill rig will be driven on to the decontamination pad and parked
- The associated drilling equipment (i.e. drill rods, augers, split spoons) will be staged on metal stands off the ground
- The drill rig and associated equipment will be thoroughly cleaned on the decontamination pad using a high-pressure steam cleaner and potable water
- Decontaminated equipment will be staged in a clean location prior to use

Direct Push Sampling Equipment

All direct push sampling equipment used to advance soil sampling equipment (i.e., The direct push rig, drill rods, MC etc.) will be decontaminated prior to arrival at and upon leaving the Site. Between each subsurface sampling location the drill rods and MC will be decontaminated. Decontamination of the drill rods and MC equipment can be done at the boring location.

Prior to leaving the site, the direct push rig will be thoroughly cleaned at the last boring location using a high-pressure steam cleaner and potable water. Since acetate liners are being used, the MC system and drill rods will be decontaminated by washing with a non phosphate detergent and rinsing with potable water. The drill rods and MC system will then be rinsed with distilled water. The decontaminated equipment will be placed in a clean location protected from fugitive dust prior to field use

Non-Disposable Sampling Equipment

All non-disposable sampling equipment (i.e. soil coring devices, sediment samplers, spoons, bowls, surface water samplers etc.) will be decontaminated prior to mobilization to each sampling location. The following procedures will be used to decontaminate the aqueous and manual sampling equipment:

- Equipment will be washed with potable water and non-phosphate detergent.
- Equipment will be thoroughly rinsed with potable water
- Equipment will be rinsed with distilled water
- Equipment used to collect samples for metals analysis will be rinsed with a 10 percent solution of laboratory grade nitric acid followed by another rinse with distilled water
- Equipment used to collect samples for organic analysis will be rinsed with pesticide-grade acetone rinse and air dried followed by another rinse with distilled water.
- Equipment will be wrapped in aluminum foil, shiny side out
- Information concerning decontamination methodology, date, time, and personnel will be recorded in the field logbook.

Field Measurement and Standard Purging Equipment

All field measurement equipment (i.e., static water level indicator, pH meter, conductivity meter or submersible pump) will be decontaminated prior to each use. Decontamination of this equipment will be conducted as described below:

- Equipment will be washed with potable water and non-phosphate detergent and a potable water rinse
- Submersible pumps will be cleaned with a non-phosphate detergent and a potable water rinse followed by a 10 gallon flush of potable water through the pump.
- Equipment will be rinsed with distilled water and allowed to air dry
- The decontaminated equipment will be placed in a clean location protected from fugitive dust prior to field use

.

Low Flow Groundwater Sampling Equipment Decontamination

New tubing will be dedicated for use in each well and will not require decontamination. The pumps, however, will require decontamination prior to and following use. If existing tubing is present in the well, O'Brien & Gere will remove and dispose of the tubing prior to installing the new tubing. Non-disposable sampling equipment, including the pump and support cable and electrical wires which contact the sample, must be decontaminated thoroughly each day before use ("daily decon") and after each well is sampled ("between-well decon"). Decon procedures are summarized below.

Daily decontamination of pumps will be conducted in the following manner:

- Pre-rinse: Operate pump in a deep basin containing 8 to 10 gallons of potable water for 5 minutes.
- Wash: Operate pump in a deep basin containing 8 to 10 gallons of a non-phosphate detergent solution, such as Alconox, for 5 minutes. Use the detergent sparingly.
- Rinse: Operate pump in a deep basin of potable water for 5 minutes.
- Disassemble pump.
- Wash pump parts: Place the disassembled parts of the pump into a deep basin containing 8 to 10 gallons of non-phosphate detergent solution. Scrub all pump parts with a brush.
- Rinse pump parts with potable water.
- Rinse the following pump parts with distilled/ deionized water: inlet screen, the shaft, the suction interconnector, the motor lead assembly, and the stator housing.
- Place impeller assembly in a large glass beaker and rinse with 1% nitric acid (HNO_3).
- Rinse impeller assembly with potable water.
- Rinse impeller assembly with distilled/deionized water.

Between-well decontamination of pumps will be conducted in the following manner:

- Pre-rinse: Operate pump in a deep basin containing 8 to 10 gallons of potable water for 5 minutes.
- Wash: Operate pump in a deep basin containing 8 to 10 gallons of a non-phosphate detergent solution, such as Alconox, for 5 minutes. Use the detergent sparingly.
- Rinse: Operate pump in a deep basin of potable water for 5 minutes.
- Final Rinse: Operate pump in a deep basin of distilled/deionized water to pump out 1 to 2 gallons of this final rinse water.

SAMPLE HANDLING, FIELD CUSTODY AND SAMPLE DOCUMENTATION PROCEDURES

Sample Handling Procedures

The following sample handling procedures will be utilized for all sampling events conducted at the facility:

- New disposable nitrile gloves will be used when collecting samples for chemical analysis
- As applicable, sample containers will be filled in the following order: VOCs, SVOCs, pesticides/PCBs, dioxins, metals, and water quality parameters (e.g. hardness).
- All aqueous VOC containers will be filled to zero headspace

After collection, the will be immediately placed in appropriate laboratory-supplied containers, labeled, maintained in coolers at 4°C, and will be maintained under a chain-of-custody (see below) at all times.

Environmental samples will be packed prior to shipment using the following procedures:

- Use only clean, sturdy coolers in good repair.
- Secure and tape the drain plug
- Be sure the lids on all bottles are tight (will not leak), place the bottles inside Ziploc plastic baggies and seal the baggies
- Put ice that has been placed in heavy-duty polyethylene Ziploc plastic baggies sealed on top of and between the samples to maintain the inside temperature at approximately 4 °C ±2 °C
- Pack samples securely to eliminate breakage during shipment
- When possible, sample container preparation and packing for shipment will be completed in a well-organized and clean area. Sample containers will be prepared for shipment by wiping containers clean of debris/water using paper towels. Paper towels will be disposed with the personal protective equipment (PPE).
- Place chain-of-custody record into a Ziploc plastic bag, tape the bag to the inner side of the cooler lid, and close the cooler and securely tape the top of the cooler shut.
- Two custody seals will be affixed to the latch and lid of the cooler. The number of the security seal will be recorded on the chain-of-custody form. The custody seals will consist of adhesive-backed tape that easily rips if it is disturbed. The field sampler will initial and date the seal. The seals must be broken to open the cooler and will indicate tampering if the seal is broken before receipt at the laboratory.
- A label containing the name and address of the shipper will be placed on the outside of the container.

The coolers will be delivered to the laboratory via a courier service. Prior to shipment of sample coolers, the field sampling team will contact the laboratory to notify the laboratory of the shipment.

Samples will remain in the custody of the sampler until transfer of custody is completed. Transfer consists of:

- Delivery of samples to courier and
- Signature of the courier on the chain-of-custody form as receiving the samples and signature of sampler as relinquishing the samples.

Sample Labeling

A completed sample identification label or tag will be attached to each investigative or QC sample. The identification on the label must be sufficient to enable cross-reference with the logbook. The sample label will be

filled out using waterproof, non-erasable ink and will be attached to the sample container using adhesive. The sample labels/tags will contain the following information:

- Sample location/number identification
- Site/Project name
- Date and time of sample collection
- Designation of the sample as a grab or composite
- Type of sample matrix
- Name/initials of the sampler
- Whether the sample is preserved or unpreserved
- Aanlyses to be performed

Unique sample identifications (IDs) will be provided for each sample. The sample IDs will include the matrix type, an indication they were collected during the second phase of the remedial investigation (R2), a grid square location and serial sample ID for surface water, sediment and soil samples, and monitoring well location for groundwater samples. Matrix types will be abbreviated as described below:

- GW for groundwater
- SW for surface water
- SO for soil
- SD for sediment

A typical sample ID would be SW-R2-E-16-3. This ID indicates the following:

- The sample is a surface water sample
- The sample was collected during the second phase of the remedial investigation
- the sample was collected from grid square E-16
- the sample is the third surface water sample collected from grid square E-16 during the second phase of the remedial investigation

Chain-of-Custody Procedures

Chain-of-custody procedures will be instituted and followed throughout the sampling collection process. Samples are physical evidence and will be handled according to strict chain-of-custody protocols. The O'Brien & Gere QAO must be prepared to produce documentation that traces the samples from the field to the laboratory and through analysis. USEPA has defined custody of evidence as follows:

- In actual possession
- In view after being in physical possession
- In a locked laboratory or in a secure, restricted area.

The field sampler is personally responsible for the care and custody of the sample until transferred.

Chain-of-custody records will be kept starting at the time that sample containers are placed in the coolers for transportation to the laboratory. One completed chain-of-custody record must be kept with each sample cooler at all times.

Example chain-of-custody forms are provided in the laboratory's Quality Assurance Manual (Exhibit 1 of the QAPP). The following measures will be taken when completing a chain-of-custody record:

- Chain-of-custody forms will be completed in waterproof, non-erasable ink.
- Chain-of-custody forms will be completed neatly using printed text.
- If a simple mistake is made, the error will be lined out with a single line and initialed and dated.
- Each separate sample entry will be sequentially numbered.
- The use of "Ditto" or quotation marks to indicate repetitive information in columnar entries should be avoided. If numerous repetitive entries must be made in the same column, a continuous vertical arrow will be used between the first entry and the next different entry.
- When more than one chain-of-custody form is used for a single shipment, each form will be consecutively numbered using the "Page ___ of ___" format.
- If necessary, additional instructions will be placed directly onto the chain-of-custody form.
- Acronyms used on a chain-of-custody form will be defined.

The chain-of-custody form will contain the following information:

- Project identification and number;
- Sample description/location;
- Required analysis;
- Date and time of sample collection;
- Type and matrix of sample;
- Number of sample containers;
- Analysis requested/comments;
- Sampler signature/date/time;
- Date and signature of the field representative;
- Date and signature of the laboratory representative;
- Carrier used to ship coolers; and
- Air bill number (if shipped by a commercial carrier).

In the case that high concentrations are suspected to be present in the samples, a note to that effect will be included on the chain-of-custody form.

Field Logbook Procedures

The field logbook will be used to note information regarding collection of samples and any observations. All entries will be signed and dated. Field logbooks will be waterproof and bound. The logbook will be dedicated to the project and pages will not be removed. Corrections will be made by drawing a single line through the incorrect data and initialing and dating the correction that was made to the side of the error. An initialed diagonal line will be used to indicate the end of an entry or the end of the day's activities.

The following information will be recorded in the field logbook by the field sampling team:

- Name and title of author, date, and time of site entry, physical/environmental conditions during the field activity and meteorological data;
- Project number, client name, Site name, names of field crew members, and names of visitors
- Sample media, sample collection method, including equipment utilized
- Date and time of sample collection, number and volume of samples collected, sample and QA/QC identification numbers, and required analyses
- Description of sample locations and the sampling process
- Field observations including field measurements made, equipment used, and soil logs
- Calculations, results, and calibration data for field sampling and measurements

- References for maps and photographs of the sample location
- Dates and method of sample shipments

After a field activity has been completed, copies of the field notes will be made and stored in the project file.

NOTES:

1. THESE FILES ARE IN THE NORTH AMERICAN DATUM 1983 NEW JERSEY STATE PLANE COORDINATE SYSTEM. THE TOPOGRAPHIC FILE REFERENCES THE NORTH AMERICAN VERTICAL DATUM 1988.
2. THE BOUNDARY LINE AS DELINEATED IS APPROXIMATE AND HAS BEEN DIGITIZED FROM A MAP ENTITLED "HERCULES INCORPORATED, KENVIL PLANT PROPERTY MAP, PLANT 080, ACCOUNT 9500, CLASSIFICATION 21045, FILE CODE 5WE REVISION 1" REVISED TO JUNE 11, 1970 PROVIDED BY REPRESENTATIVES OF HERCULES, INC., AND THE TAX MAP OF THE TOWNSHIP OF ROXBURY AND NOT FROM AN ACTUAL FIELD SURVEY OR WITH THE BENEFIT OF A TITLE SEARCH.
3. GROUNDWATER REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE GROUNDWATER SITE INCESTIGATION(GW–SI) REPORT (MWH, 2004). SURFACE WATER REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SURFACE WATER/SEDIMENT SITE INVESTIGATION (SW/SD–SI) REPORT (MWH, 2004).
4. SAMPLE LOCATIONS PRESENTED IN THIS FIGURE WERE COLLECTED DURING THE REMEDIAL INVESTIGATION.
5. SOLID BROWN LINES REPRESENT DRY STREAM SEDIMENTS OR FORMER DITCHES THAT NO LONGER CONVEY WATER SINCE MANUFACTURING OPERATIONS HAVE CEASED. THESE AREAS ARE NO LONGER CONSIDERED SURFACE WATER OR SEDIMENT BODIES AND ARE CONSIDERED SOIL IN THE REMEDIAL INVESTIGATION REPORT.
6. DASHED BROWN LINES REPRESENT STREAM SEDIMENTS OR AREAS WITHOUT SUFFICIENT WATER PRESENT FOR SURFACE WATER SAMPLE COLLECTION, HOWEVER SATURATED SEDIMENTS ARE PRESENT.
7. MW–5P AND MW–22 COULD NOT BE SAMPLED DUE TO DAMAGE INCURRED DURING DEMOLITION EFFORTS.
8. PLAN ADAPTED FROM DRAWING TITLED "GROUNDWATER – SAMPLE LOCATION MAP" AS PRESENTED IN THE REMEDIAL INVESTIGATION REPORT, VOLUME C – GROUNDWATER FIGURE C–1 PRODUCED BY MWH AMERICAS, INC..

- STREAMS
- TRAIL/DIRT ROAD
- ELECTRIC SUBSTATION
- BUILDING

NOTES:

1. THESE FILES ARE IN THE NORTH AMERICAN DATUM 1983 NEW JERSEY STATE PLANE COORDINATE SYSTEM. THE TOPOGRAPHIC FILE REFERENCES THE NORTH AMERICAN VERTICAL DATUM 1988.
2. THE BOUNDARY LINE AS DELINEATED IS APPROXIMATE AND HAS BEEN DIGITIZED FROM A MAP ENTITLED "HERCULES INCORPORATED, KENVIL PLANT PROPERTY MAP, PLANT 080, ACCOUNT 9600, CLASSIFICATION 21046, FILE CODE 5WE, REVISION 1" REVISED TO JUNE 11, 1970 PROVIDED BY REPRESENTATIVES OF HERCULES, INC., AND THE TAX MAP OF THE TOWNSHIP OF ROXBURY AND NOT FROM AN ACTUAL FIELD SURVEY OR WITH THE BENEFIT OF A TITLE SEARCH.
3. SOIL REMEDIAL INVESTIGATION SAMPLE LOCATIONS WERE SELECTED BASED ON ANALYTICAL RESULTS PRESENTED IN THE SOILS SITE INCESTIGATION(SOILS-SI) REPORT (MWH, 2004) AND A UNIFORM GRID SYSTEM
4. SEDIMENT SAMPLES COLLECTED FROM FORMER DRAINAGE AREAS ARE NO LONGER CONSIDERED AS SEDIMENTS AND ARE NOW DEFINED AS SOILS. TWENTY-NINE SI SEDIMENT SAMPLES WERE RE-DEFINED AS SOIL SAMPLES IN THE REMEDIAL INVESTIGATION REPORT (RIR). REFER TO TEXT (VOLUME B) FOR MORE DETAILED DEFINITION.
5. SOLID BROWN LINES REPRESENT DRY STREAM SEDIMENTS OR FORMER DITCHES THAT NO LONGER CONVEY WATER SINCE MANUFACTURING OPERATIONS HAVE CEASED. THESE AREAS ARE NO LONGER CONSIDERED SURFACE WATER OR SEDIMENT BODIES AND ARE CONSIDERED SOIL IN THE REMEDIAL INVESTIGATION REPORT.
6. DASHED BROWN LINES REPRESENT STREAM SEDIMENTS OR AREAS WITHOUT SUFFICIENT WATER PRESENT FOR SURFACE WATER SAMPLE COLLECTION, HOWEVER SATURATED SEDIMENTS ARE PRESENT.
7. SITE INVESTIGATION SEDIMENT SAMPLE LOCATIONS DENOTED IN PURPLE ARE INCLUDED IN VOLUME B AND HAVE BEEN EXCLUDED FROM VOLUME D - SEDIMENT REMEDIAL INVESTIGATION. THESE SAMPLES ARE NO LONGER CONSIDERED AS SEDIMENTS AND ARE MORE PROPERLY DEFINED AS SOILS.
8. PLAN ADAPTED FROM DRAWING TITLED "SOIL - SAMPLE LOCATION MAP" AS PRESENTED IN THE REMEDIAL INVESTIGATION REPORT, VOLUME B - SOILS FIGURE B-1 PRODUCED BY MWH AMERICAS, INC.

Proposed Off-Site Groundwater Sample Locations

Appendix C

Photographs of Select Sediment Sample Locations

APPENDIX C – PHOTOGRAPHIC LOG

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
1	11/5/13

DESCRIPTION

Looking northeast at sample location SW-R2-G-12-3, situated approximately 10 ft downstream of a culverted stormwater outfall. The culvert conveyed water into a small, deep depression surrounded by tall grasses.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
2	11/5/13

DESCRIPTION

Looking into the deeply eroded channel where locations SW-R2-E-11-1 and SW-R2-F-11-1 were proposed. At the time of the field investigation, no surface water was present at either location.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
3	11/5/13

DESCRIPTION

Looking down into the center of a deeply eroded channel where locations SW-R2-E-11-1 and SW-R2-F-11-1 were proposed. Upon investigation, the channel's substrate appeared to be composed largely of fill and silt, with some cobbles.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
4	11/5/13

DESCRIPTION

There was no surface water present at sample location SW-R2-G-12-2. The soils in the area were dry, suggesting that surface water flow in the immediate area ceased long before the sampling effort.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
5	11/5/13

DESCRIPTION

Looking southwest from location SW-R2-G-12-2. The entire area surrounding this proposed sample location was devoid of surface water at the time of the field visit.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
6	11/4/13

DESCRIPTION

Looking northeast at sample location SW-R2-L-5-1. A wide, channeled depression that once conveyed overland flow towards the east side of Duck Pond, no surface water was present at this location at the time of the sampling effort.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
7	11/4/13

DESCRIPTION

Looking southeast across Duck Pond, near sampling location SW-R2-L-5-2. The sample was collected in approximately 6 inches of water in the mucky shallows pictured.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
8	11/6/13

DESCRIPTION

Looking at sample location SW-R2-E-13-1, which was proposed in a lowland depression overgrown with cattails, moss, and tussock sedges. No surface water was present at the time of the site visit.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
9	11/6/13

DESCRIPTION

Looking north near sample locations SW-R2-D-12-1 and SW-R2-D-12-3, which were positioned just downstream of a pool emanating from a sheet metal culvert. The channel was mostly shallow, with much organic debris.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
10	11/6/13

DESCRIPTION

Looking down at sample location SW-R2-D-12-3. Organic debris including full logs disrupted flow of this small stream channel.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
11	11/5/13

DESCRIPTION

Looking south across the area from which sample SW-R2-N-5-1 was collected, a mucky swamp area with deep standing water.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
12	11/5/13

DESCRIPTION

Looking northeast at sample location SW-R2-E16-3, which was situated alongside a stream flowing south and off of the Site.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
13	11/6/13

DESCRIPTION

There was no surface water present at sample location SW-R2-C-11-1, a transitional area situated along the edge of a thick stand of Common Reed.

CLIENT NAME:	SITE LOCATION:	PROJECT NO.
Hercules Incorporated	Kenvil, New Jersey	2420|50725

PHOTO NO.	DATE:
14	11/6/13

DESCRIPTION

Looking southwest at sample location SW-R2-B-15-2, which was positioned on the northern edge of a large bog. The water at this location was full of well-degraded organic content.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 6020, September 1994.

06050 ICP/MS SW-846 Water Digest

The sample is digested with nitric acid.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 3010A Modified, July 1992

05708 SW SW846 ICP/ICP MS Digest

The sample is digested with nitric acid, hydrochloric acid and hydrogen peroxide.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 3050B, December 1996

06915 Nitroaromatics/Amines Wat Ext

The sample is passed through a Porapak RDX cartridge. The cartridge is then eluted with acetonitrile and the extract is brought to 5 mL. The extract is diluted to 10 mL using a calcium chloride solution.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 8330, September 1994.

06916 Nitroaromatics/Amines in Water

The sample is extracted into acetonitrile using SPE on a Porapak RDX cartridge. The extract is analyzed using High Performance Liquid Chromatography with UV detection at two wavelengths for optimum sensitivity for all target compounds 214 and 254 nm. Confirmation of presumptive peaks is performed on a second column at the same two wavelengths.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 8330, September 1994.

06917 Nitroaromatics/Amines Sol Ext

The sample is extracted with acetonitrile in a vial using a chilled ultrasonic bath. The vial is centrifuged and the acetonitrile removed. The extract is brought to volume with calcium chloride solution and filtered prior to analysis.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 8330, September 1994.

06918 Nitroaromatics/Amines in Solid

The sample is extracted into acetonitrile using an ultrasonic bath. The extract is analyzed using High Performance Liquid Chromatography (HPLC) with UV detection at two wavelengths for optimum sensitivity for all target compounds 214 and 254 nm. Confirmation of presumptive peaks is performed on a second column at the same two wavelengths.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 8330, September 1994.

00813 BNA Water Extraction

The sample aliquot is extracted with methylene chloride by either separatory funnel or liquid/liquid apparatus. Extraction is performed at both a pH of 11 and 2. The extract is concentrated prior to analysis.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 3510C, December 1996

10724 PAH 8270 (microwave)
10727 TCL 8270 (microwave)
04678 TCL SW846 Semivolatiles/Waters

The sample extract is analyzed by capillary column Gas Chromatography/Mass Spectrometry.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 8270C, December 1996

10809 BNA Soil Microwave
10814 BNA Soil Microwave PAH

The sample aliquot is extracted using microwave extraction with 1:1 methylene chloride and acetone. The extract is concentrated prior to analysis.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 3546, Revision 0, February 2007.

00383 TOC by Lloyd Kahn

Total organic carbon is determined by acidifying a sample aliquot and heating it to remove any inorganic carbon. The sample is then heated to 900oC for combustion of the remaining organic carbon. The resulting carbon dioxide from the organic carbon is detected by a nondispersive infrared detector that has been calibrated to directly display the mass of carbon dioxide detected. The mass is proportional to the mass of total organic carbon in the sample.

Reference: Lloyd Kahn (modified)

00273 Total Organic Carbon

TOC is determined by first removing the inorganic carbon from a sample. The remaining carbon is then oxidized to carbon dioxide, which is measured by a nondispersive infrared detector. The mass of carbon dioxide detected is proportional to the mass of TOC in the sample.

Reference: Standard Methods for the Examination of Water and Wastewater, 21st Edition, 2005, Method 5310 C-2000

12152 pH

The activity of hydrogen ions in the sample is measured using a glass electrode and a reference electrode.

Reference: Standard Methods for the Examination of Water and Wastewater, 21st Edition, 2005, Method 4500 H/B-2000

12147 Total Hardness

The concentration of calcium and magnesium ions is determined by titration with EDTA to a blue endpoint, in the presence of Eriochrome Black T indicator. The result is expressed in mg/L calcium carbonate.

Reference: Standard Methods for the Examination of Water and Wastewater, 20th Edition, 1998, Method 2340 C-1997

00111 Moisture

A well-mixed sample is placed in a tared container and dried to a constant weight in an oven at 103-105C. The increase in weight is the total solids.

Reference: Standard Methods for the Examination of Water and Wastewater, 20th Edition, 1998, Method 2540 G-1997

CAT No.	Analysis Name	CAS Number	Dry Result	Dry Method Detection Limit*	Dry Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**mg/kg**	**mg/kg**	**mg/kg**	
10727	2-Methylphenol	95-48-7	N.D.	0.59	1.2	20
10727	4-Methylphenol	106-44-5	N.D.	0.59	1.2	20
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	0.12	0.61	20
10727	2-Nitroaniline	88-74-4	N.D.	0.59	1.2	20
10727	3-Nitroaniline	99-09-2	N.D.	2.4	5.9	20

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.

General Sample Comments

State of New Jersey Lab Certification No. PA011

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.

General Sample Comments

State of New Jersey Lab Certification No. PA011

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.

General Sample Comments

State of New Jersey Lab Certification No. PA011

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

The 40 CFR Part 136 requires that this analysis be performed immediately (within 15 minutes) upon sample collection. Because this was not possible, the result may not be used for reporting purposes.

General Sample Comments

State of New Jersey Lab Certification No. PA011

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

The 40 CFR Part 136 requires that this analysis be performed immediately (within 15 minutes) upon sample collection. Because this was not possible, the result may not be used for reporting purposes.

General Sample Comments

State of New Jersey Lab Certification No. PA011

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

04678	2,4,5-Trichlorophenol	95-95-4	N.D.	0.5	1	1
04678	2,4,6-Trichlorophenol	88-06-2	N.D.	0.5	1	1
	Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials with the exception of: bis(2-Ethylhexyl)phthalate was not detected in the re-extraction.

Analysis Report

Sample Description: Trip Blank Grab Water Sample
Hercules Phase II R.I.

LL Sample # WW 7263061
LL Group # 1431224
Account # 06716

Project Name: Hercules Phase II R.I.

Collected: 11/04/2013

Submitted: 11/04/2013 19:30
Reported: 11/25/2013 08:14

Ashland, Inc.
Bldg. 8139-48
500 Hercules Road
Wilmington DE 19808-1599

TBLHE SDG#: KVM03-11TB*

General Sample Comments

State of New Jersey Lab Certification No. PA011

Quality Control Summary

Client Name: Ashland, Inc. Group Number: 1431224
Reported: 11/25/13 at 08:14 AM

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Sent: Tuesday, November 05, 2013 2:00 PM
To: Wendy Kozma
Cc: Robert P. Barnes
Subject: RE: Acknowledgement(1431224, Hercules Phase II R.I., 11/04/2013 19:30:00)

Wendy,

I have a few changes to the chain-of-custody. The following sample ID's need to be revised:

ID on Chain	Actual Sample ID
W	SD-R2-L-5-01D
X	SD-R2-L-5-02 D
P	SD-R2-K-5-2
O	SD-R2-K-5-1
FF	SW-R2-L-5-2
DD	SW-R2-M-5-1
EE	SW-R2-M-5-2

The analyte list for the sediment samples also need to be revised as indicated below:

ID on Chain	Actual Sample ID	Analyte List
W	SD-R2-L-5-01D	SVOCs, E&E Compounds, TAL Metals, moisture, solids, TOC
X	SD-R2-L-5-02 D	SVOCs, E&E Compounds, TAL Metals, moisture, solids, TOC
P	SD-R2-K-5-2	PAHs, E&E Compounds, TAL Metals, moisture, solids, TOC
O	SD-R2-K-5-1	PAHs, E&E Compounds, TAL Metals, moisture, solids, TOC

Also, the analytic list for FB-02_11042013 should be: SVOCs, E&E Compounds, TAL Metals, TOC.

Please let me know if you have any questions.

Thanks,

John

Good afternoon John, A few questions on this first submittal group:

1) Do you need us to provide a validation package and/or EDD? If so, send directly to you?
2) I have the results being sent to you and Ed. Is this OK?
3) For some reason the field submitted a TB with no VOA samples. We will just hold it (not run it).

OK--thanks for letting me know.

Does this include the Surfacewater/Sediment received this week?
And I'm confirming non-interpretive TICs? 10 VOC and 20 SVOC?

Subject: Ashland

Wendy,

For all VOC and SVOC analyses we need to run TICs

John

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J - estimated value – The result is ≥ the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers

A	TIC is a possible aldol-condensation product
B	Analyte was also detected in the blank
C	Pesticide result confirmed by GC/MS
D	Compound quantitated on a diluted sample
E	Concentration exceeds the calibration range of the instrument
N	Presumptive evidence of a compound (TICs only)
P	Concentration difference between primary and confirmation columns >25%
U	Compound was not detected
X,Y,Z	Defined in case narrative

Inorganic Qualifiers

B	Value is <CRDL, but ≥IDL
E	Estimated due to interference
M	Duplicate injection precision not met
N	Spike sample not within control limits
S	Method of standard additions (MSA) used for calculation
U	Compound was not detected
W	Post digestion spike out of control limits
*****	Duplicate analysis not within control limits
+	Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Samples were received in good condition and within temperature requirements.

HOLDING TIME:

All holding times were met.

PREPARATION/EXTRACTION/DIGESTION:

No problems were encountered.

CALIBRATION/STANDARDIZATION:

All criteria were met.

QUALITY CONTROL AND NONCONFORMANCE SUMMARY:

Method Blank

For noncompliant preparation/method blanks, corrective action is not required if the sample is ND or > 10 times the blank concentration, unless otherwise specified in the method or by the client.

eurofins | Lancaster Laboratories Environmental

Case Narrative/Conformance Summary

CLIENT: Ashland, Inc.
SDG: KVM03

GC/MS Semivolatiles

Fraction: Semivolatiles by GC/MS

(Sample number(s): 7263058: Analysis: 04678)
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken:
The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials with the exception of:
bis(2-Ethylhexyl)phthalate was not detected in the re-extraction.

LCS/LCSD

(Sample number(s): 7263052-7263053: Analysis: 10727)
The recovery for a target analyte(s) in the Laboratory Control Spike(s) is outside the QC acceptance limits as noted on the QC Summary. Since the recovery is high and the target analyte(s) was not detected in the sample, the data is reported.

MS/MSD

Matrix QC may not be included if site-specific QC were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, laboratory spike data (LCS) are provided.

SAMPLE ANALYSIS:

(Sample number(s): 7263052-7263053: Analysis: 10727)
Reporting limits were raised due to interference from the sample matrix.

(Sample number(s): 7263054-7263055: Analysis: 10724)
Reporting limits were raised due to interference from the sample matrix.

No other problems were encountered with the analysis of the samples.

Abbreviation Key

UNSPK = Unspiked (for MS/MSD)	LOQ = Limit of Quantitation
MS = Matrix Spike	MDL = Method Detection Limit
MSD = Matrix Spike Duplicate	ND = Not Detected
BKG = Background (for Duplicate)	J = Estimated Value
D = Duplicate (DUP)	E= out of calibration range
LCS = Lab Control Sample	RE = Repreparation/Reanalysis
LCSD = Lab Control Sample Duplicate	* = Out of Specification

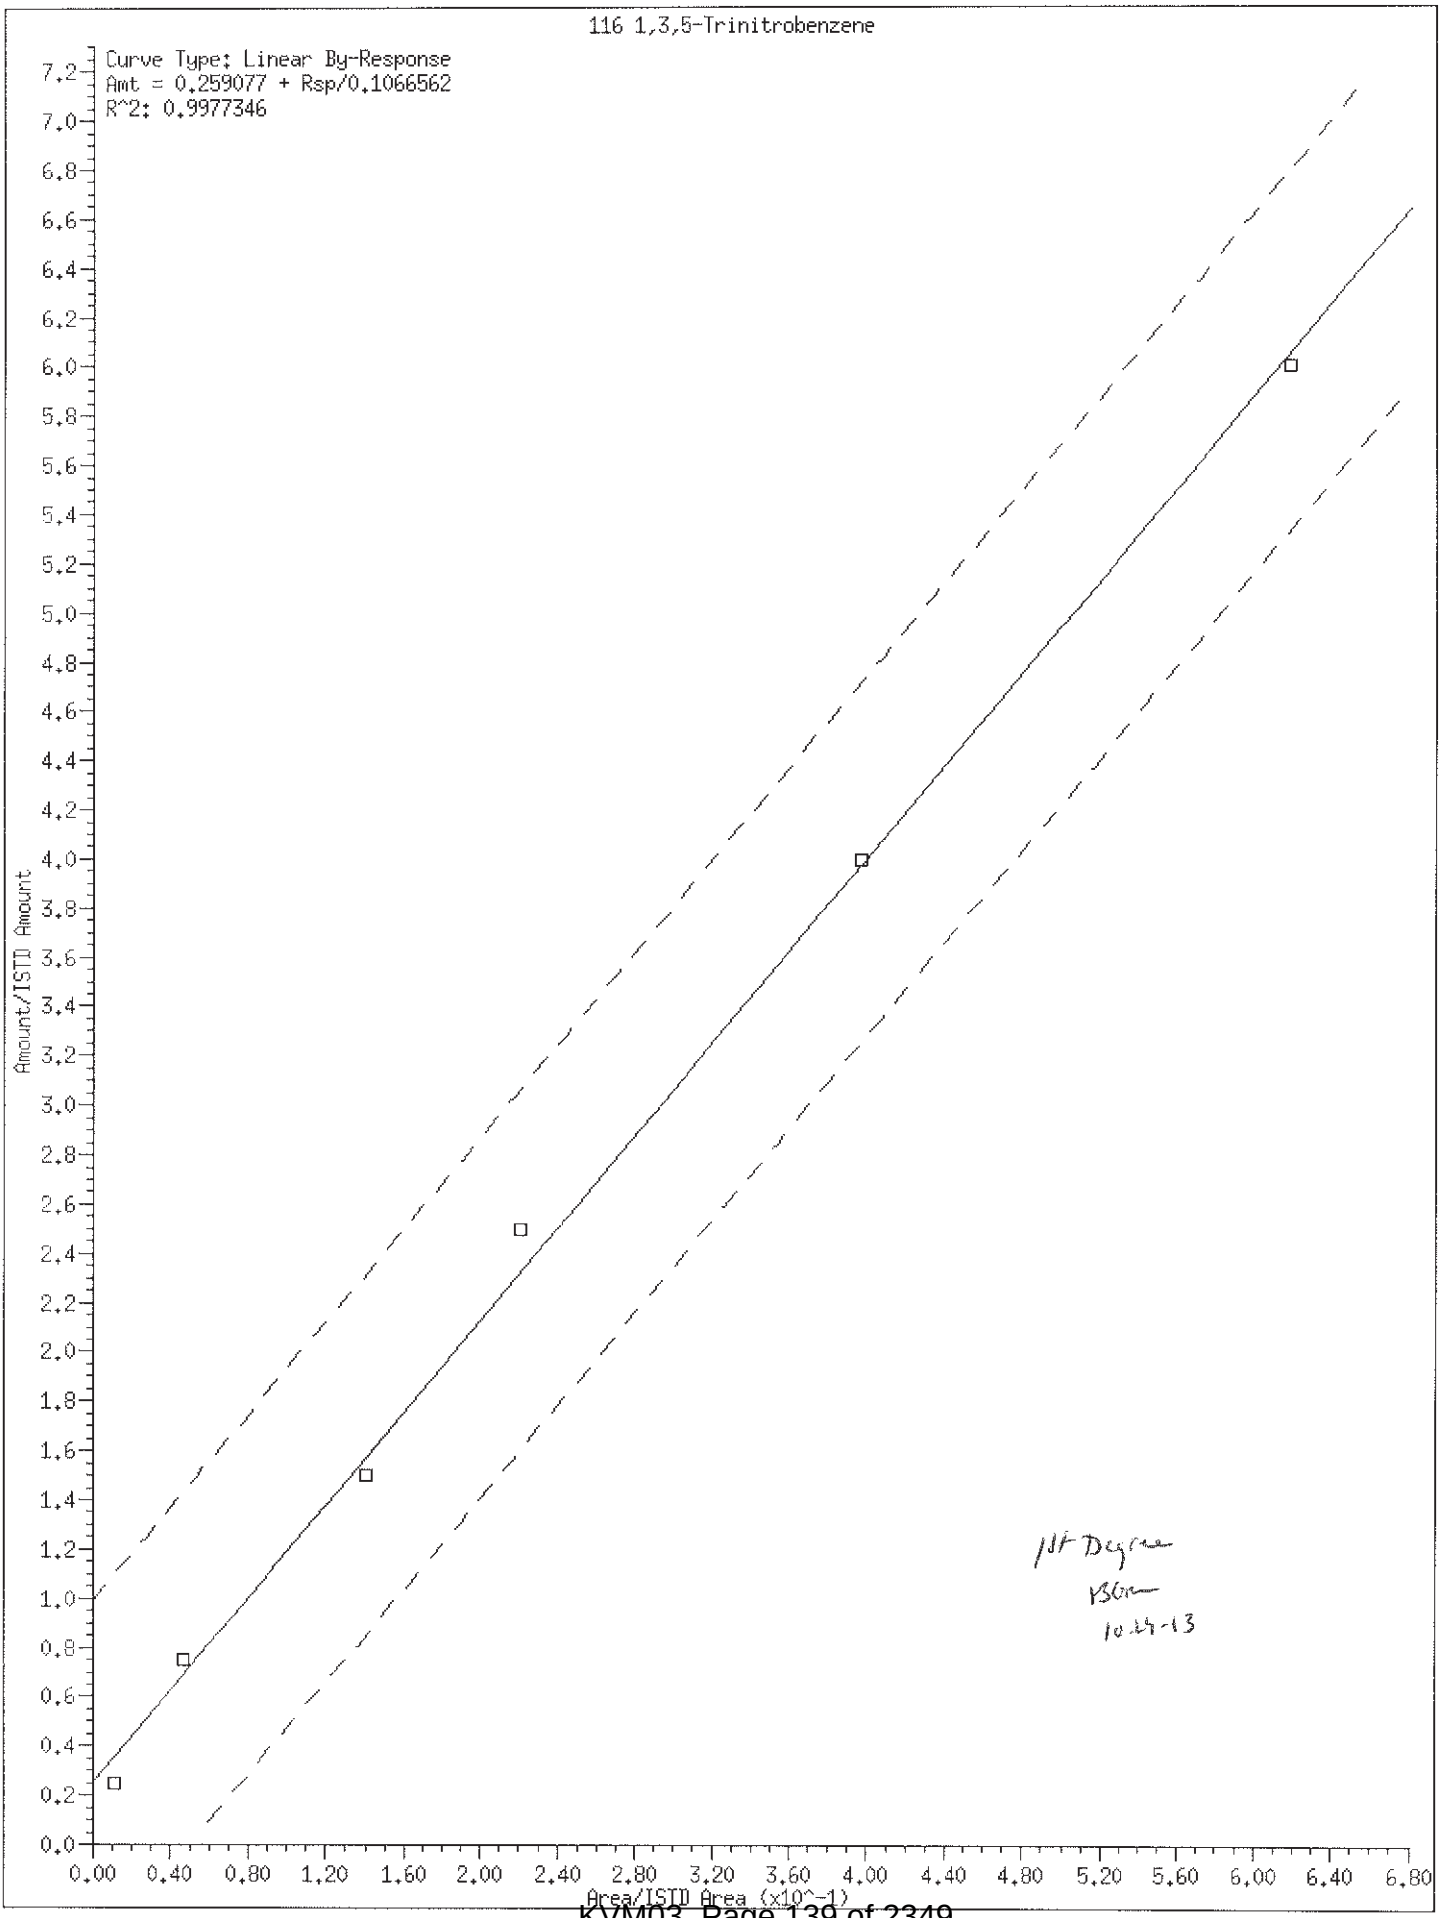
Average %RSD 7



4,6-Dinitro-2-methylphenol and 4-Nitrophenol are at 10 ng/ul in the 5 standard.
Benzidine Levels in the 5,15,30,50,80,120 standards are 15,45,90,150,240,360 ng/ul, respectively.
Benzoic acid, Pentachlorophenol and 2,4-Dinitrophenol are at 15 ng/ul, 30 ng/ul,40 ng/ul in the 5,15,30 standards.

4,6-Dinitro-2-methylphenol and 4-Nitrophenol are at 10 ng/ul in the 5 standard.
Benzidine Levels in the 5,15,30,50,80,120 standards are 15,45,90,150,240,360 ng/ul, respectively.
Benzoic acid, Pentachlorophenol and 2,4-Dinitrophenol are at 15 ng/ul, 30 ng/ul,40 ng/ul in the 5,15,30 standards.

Internal Standard Area and Retention Time Summary

Initial Calibration Standards:

/chem/HP11165.i/13nov11a.b/gk0393.d SSTD050
/chem/HP11165.i/13nov11a.b/gk0394.d SSTD005

Average %RSD 6

4,6-Dinitro-2-methylphenol and 4-Nitrophenol are at 10 ng/ul in the 5 standard.
Benzidine Levels in the 5,15,30,50,80,120 standards are 15,45,90,150,240,360 ng/ul, respectively.
Benzoic acid, Pentachlorophenol and 2,4-Dinitrophenol are at 15 ng/ul, 30 ng/ul,40 ng/ul in the 5,15,30 standards.

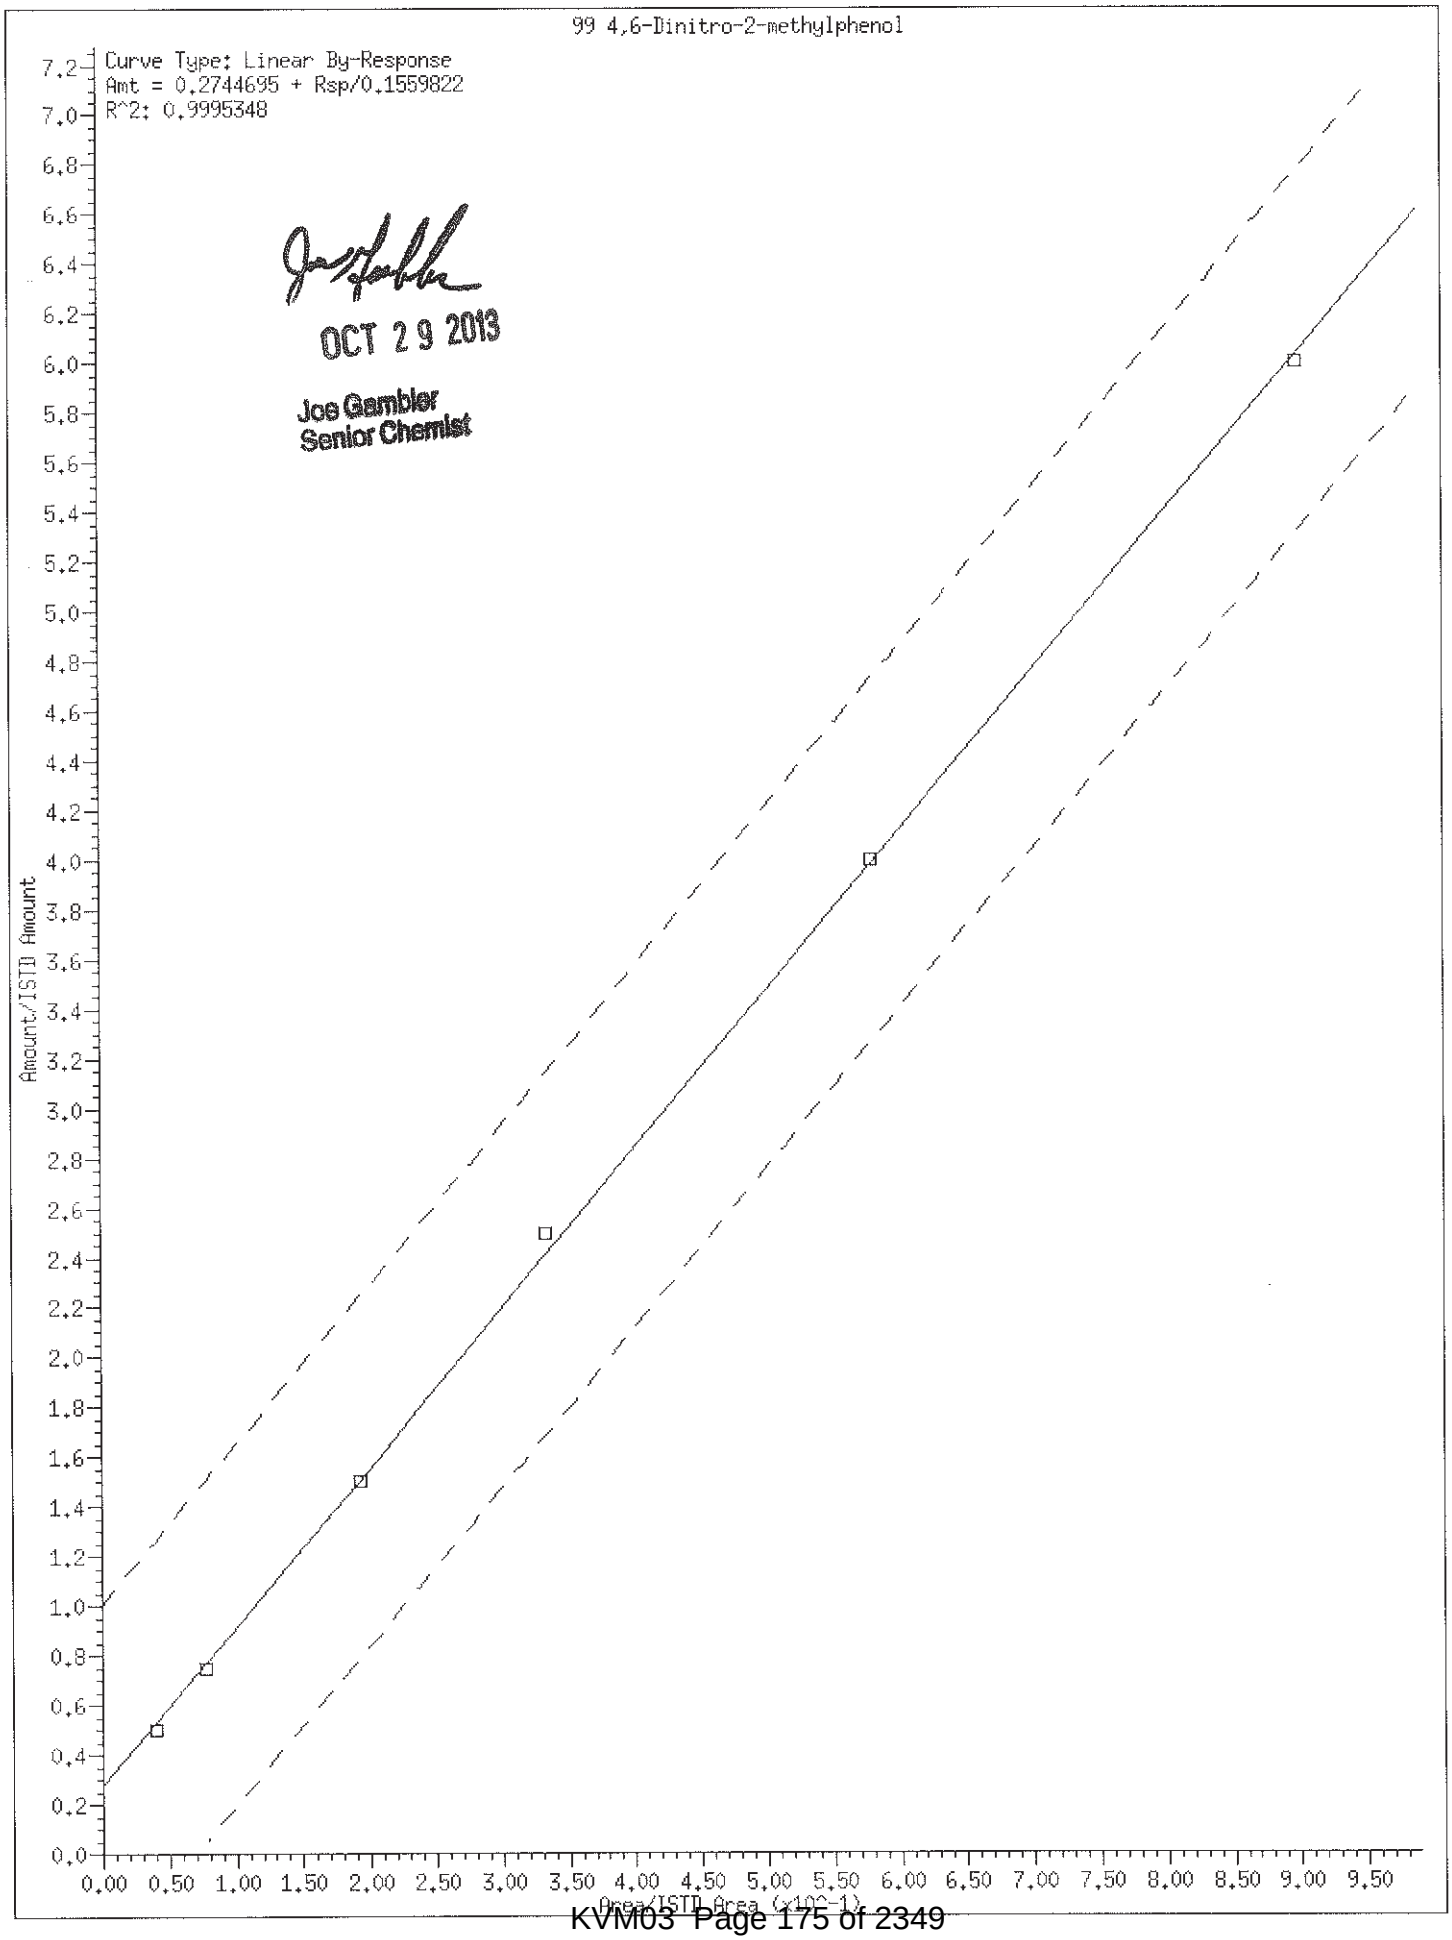
Average %RSD 7



4,6-Dinitro-2-methylphenol and 4-Nitrophenol are at 10 ng/ul in the 5 standard.
Benzidine Levels in the 5,15,30,50,80,120 standards are 15,45,90,150,240,360 ng/ul, respectively.
Benzoic acid, Pentachlorophenol and 2,4-Dinitrophenol are at 15 ng/ul, 30 ng/ul,40 ng/ul in the 5,15,30 standards.

** indicates the Mid Level Calibration Standard.

Mid Level Calibration Standard is used for comparison.

Current Continuing Calibration Standard:

/chem/HP10623.i/13nov13a.b/ck0461.d

Area Summary

File ID:

Internal Standard Name	ck0461.d	ICAL Area	Low Limit	High Limit	In Spec
1,4-Dichlorobenzene-d4	119096	131335	65668	262670	Yes
Naphthalene-d8	567152	603190	301595	1206380	Yes
Acenaphthene-d10	363022	377352	188676	754704	Yes
Phenanthrene-d10	690322	694958	347479	1389916	Yes
Pyrene-d10	847467	855313	427656	1710626	Yes
Perylene-d12	700104	733981	366990	1467962	Yes

A "No" indicates the internal standard area is outside acceptable QC limits.

RT Summary

File ID:

Internal Standard Name	ck0461.d	ICAL RT	In Spec
1,4-Dichlorobenzene-d4	5.201	5.226	Yes
Naphthalene-d8	6.437	6.461	Yes
Acenaphthene-d10	8.146	8.177	Yes
Phenanthrene-d10	9.591	9.622	Yes
Pyrene-d10	10.974	10.999	Yes
Perylene-d12	13.575	13.606	Yes

A "No" indicates the retention time is greater than 30 seconds from the RT of the referenced standard.

** indicates the Mid Level Calibration Standard.

Mid Level Calibration Standard is used for comparison.

Current Continuing Calibration Standard:

/chem/HP19760.i/13nov14b.b/dk0512.d

Area Summary

File ID:

Internal Standard Name	dk0512.d	ICAL Area	Low Limit	High Limit	In Spec
1,4-Dichlorobenzene-d4	96017	151909	75954	303818	Yes
Naphthalene-d8	372726	608104	304052	1216208	Yes
Acenaphthene-d10	219681	340173	170086	680346	Yes
Phenanthrene-d10	359468	574655	287328	1149310	Yes
Pyrene-d10	459485	743541	371770	1487082	Yes
Perylene-d12	328252	528760	264380	1057520	Yes

A "No" indicates the internal standard area is outside acceptable QC limits.

RT Summary

File ID:

Internal Standard Name	dk0512.d	ICAL RT	In Spec
1,4-Dichlorobenzene-d4	5.854	6.029	Yes
Naphthalene-d8	7.818	7.987	Yes
Acenaphthene-d10	10.622	10.797	Yes
Phenanthrene-d10	12.534	12.691	Yes
Pyrene-d10	14.457	14.649	Yes
Perylene-d12	18.899	19.120	Yes

A "No" indicates the retention time is greater than 30 seconds from the RT of the referenced standard.

Area Summary

File ID:

Internal Standard Name	gk0511.d	ICAL Area	Low Limit	High Limit	In Spec
1,4-Dichlorobenzene-d4	77606	92425	46212	184850	Yes
Naphthalene-d8	374010	446720	223360	893440	Yes
Acenaphthene-d10	231911	286597	143298	573194	Yes
Phenanthrene-d10	436601	544867	272434	1089734	Yes
Pyrene-d10	517775	628070	314035	1256140	Yes
Perylene-d12	441467	495666	247833	991332	Yes

A "No" indicates the internal standard area is outside acceptable QC limits.

RT Summary

File ID:

Chad A. Moline
Senior Chemist

NOV 13 2013

Internal Standard Name	gk0511.d	ICAL RT	In Spec
1,4-Dichlorobenzene-d4	5.599	5.749	Yes
Naphthalene-d8	6.835	6.990	Yes
Acenaphthene-d10	8.552	8.707	Yes
Phenanthrene-d10	10.007	10.162	Yes
Pyrene-d10	11.392	11.547	Yes
Perylene-d12	14.045	14.222	Yes

A "No" indicates the retention time is greater than 30 seconds from the RT of the referenced standard.

** indicates the Mid Level Calibration Standard.

Mid Level Calibration Standard is used for comparison.

Current Continuing Calibration Standard:

/chem/HP18831.i/13nov08.b/hk0251.d

Area Summary

File ID:

Internal Standard Name	hk0251.d	ICAL Area	Low Limit	High Limit	In Spec
1,4-Dichlorobenzene-d4	101984	187821	93910	375642	Yes
Naphthalene-d8	397290	721826	360913	1443652	Yes
Acenaphthene-d10	252327	452920	226460	905840	Yes
Phenanthrene-d10	440301	790436	395218	1580872	Yes
Pyrene-d10	552473	974611	487306	1949222	Yes
Perylene-d12	420890	732405	366202	1464810	Yes

A "No" indicates the internal standard area is outside acceptable QC limits.

RT Summary

File ID:

Internal Standard Name	hk0251.d	ICAL RT	In Spec
1,4-Dichlorobenzene-d4	6.751	6.896	Yes
Naphthalene-d8	8.680	8.826	Yes
Acenaphthene-d10	11.472	11.606	Yes
Phenanthrene-d10	13.360	13.489	Yes
Pyrene-d10	15.313	15.465	Yes
Perylene-d12	19.772	19.953	Yes

A "No" indicates the retention time is greater than 30 seconds from the RT of the referenced standard.

Instrument: HP10623.i

Sample Info: 50 NG/UL;DFTPP2843;

Operator: jmg00346

Column phase: DB-5

Column diameter: 0.25

Data File: ck0400y.d
Spectrum: Avg. Scans 162-164 (3.95), Background Scan 156
Location of Maximum: 198.00
Number of points: 290

m/z	Y	m/z	Y	m/z	Y	m/z	Y
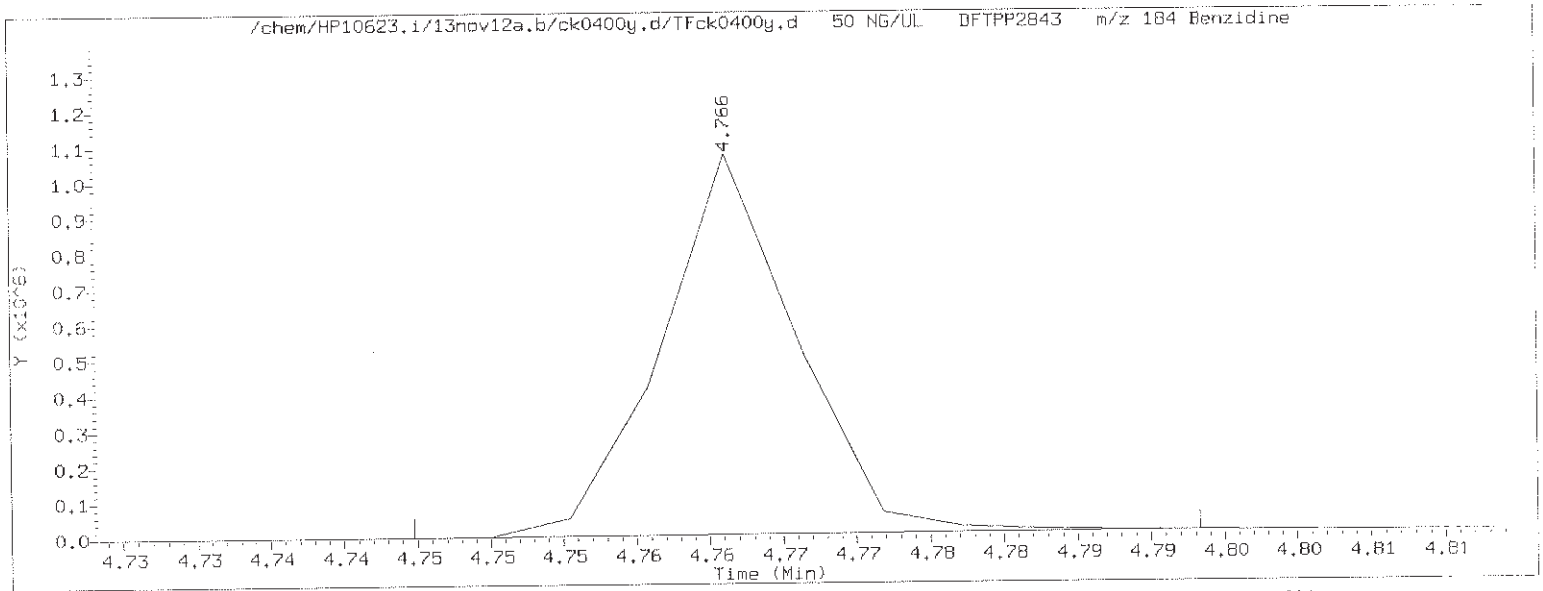
115.00	50	189.00	1162	269.00	57	445.00	70
116.00	1125	190.00	284	270.00	66		
117.00	14669	191.00	349	271.00	57		

Assessment of GC Column Performance and Injection Port Inertness for

Instrument ID: HP10623.i Injection Date: 12-NOV-2013 09:23 Operator: jmg00346



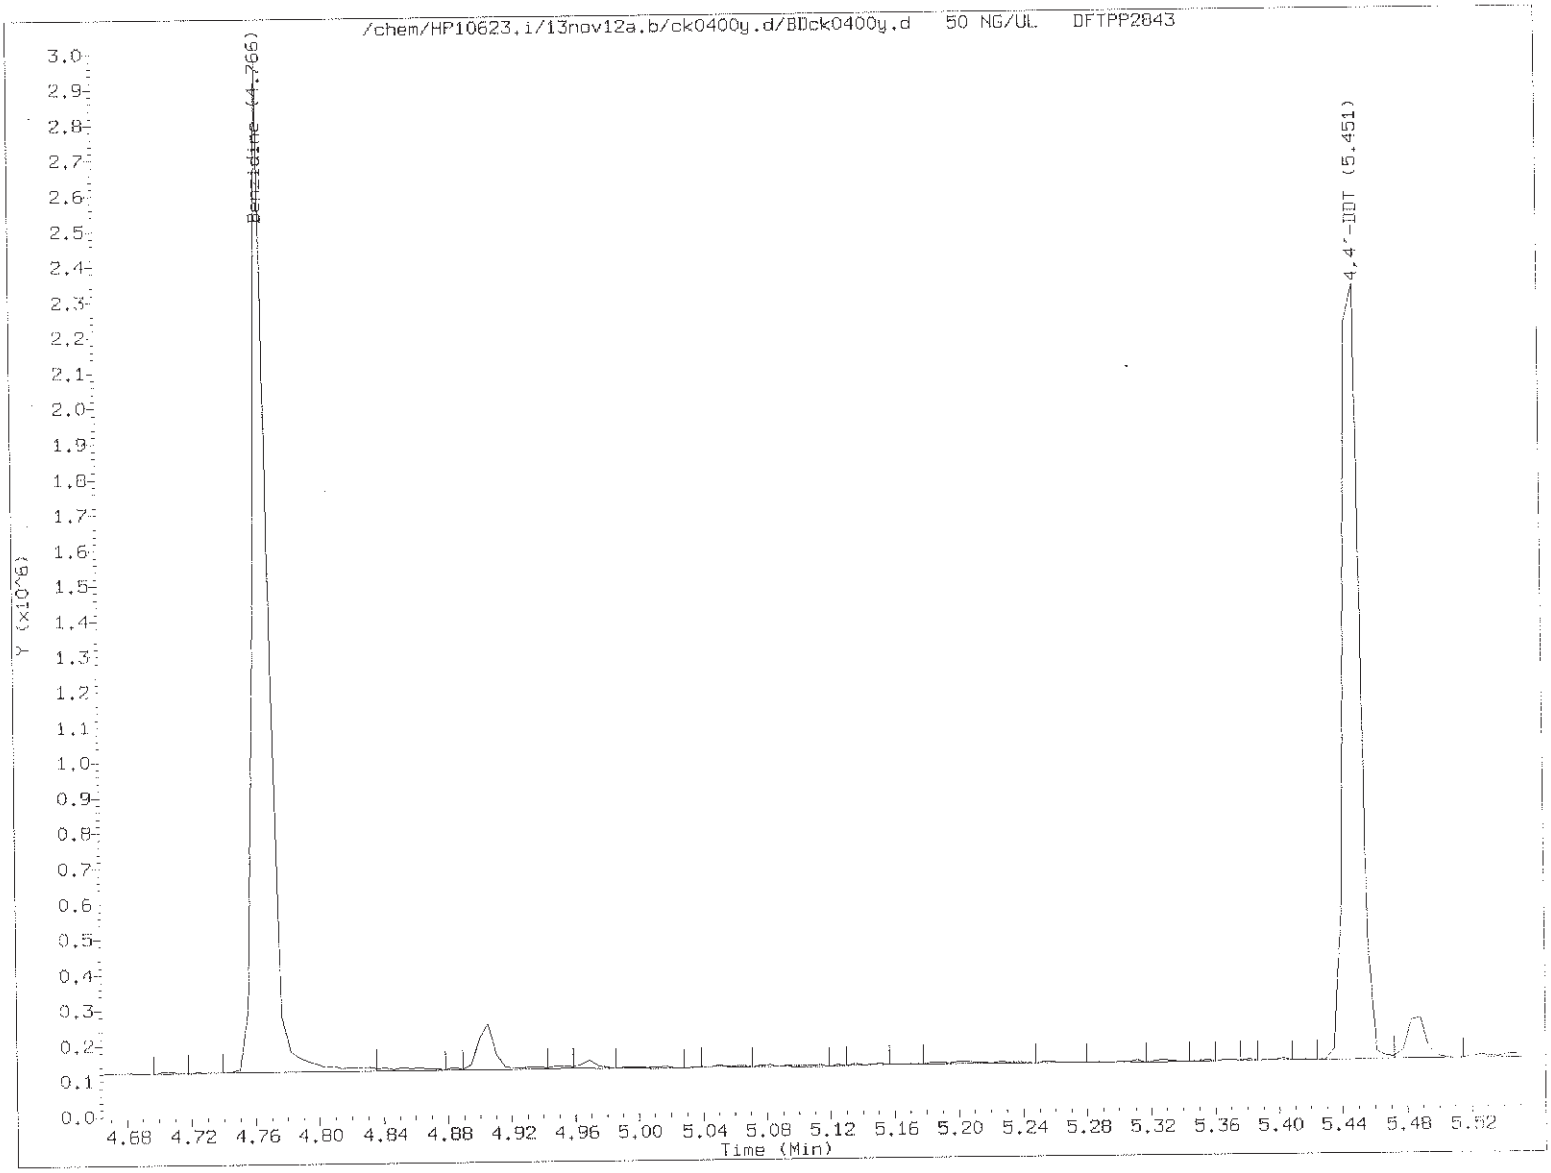
Pentachlorophenol EICP peak height = 98872 EICP peak height at 10% = 9887 Pentachlorophenol EICP area = 76266

Pentachlorophenol EICP peak apex (min.) = 3.525
RT at 10% of front half of EICP (min.) = 3.513
RT at 10% of back half of EICP (min.) = 3.534

'Front' peak width (min.) = 0.0118500000
'Tailing' peak width (min.) = 0.0091500000

$$\text{PCP tailing factor} = \frac{\text{'Tailing' peak width (min.)}}{\text{'Front' peak width (min.)}} = \frac{0.0091500000}{0.0118500000} = 0.772$$

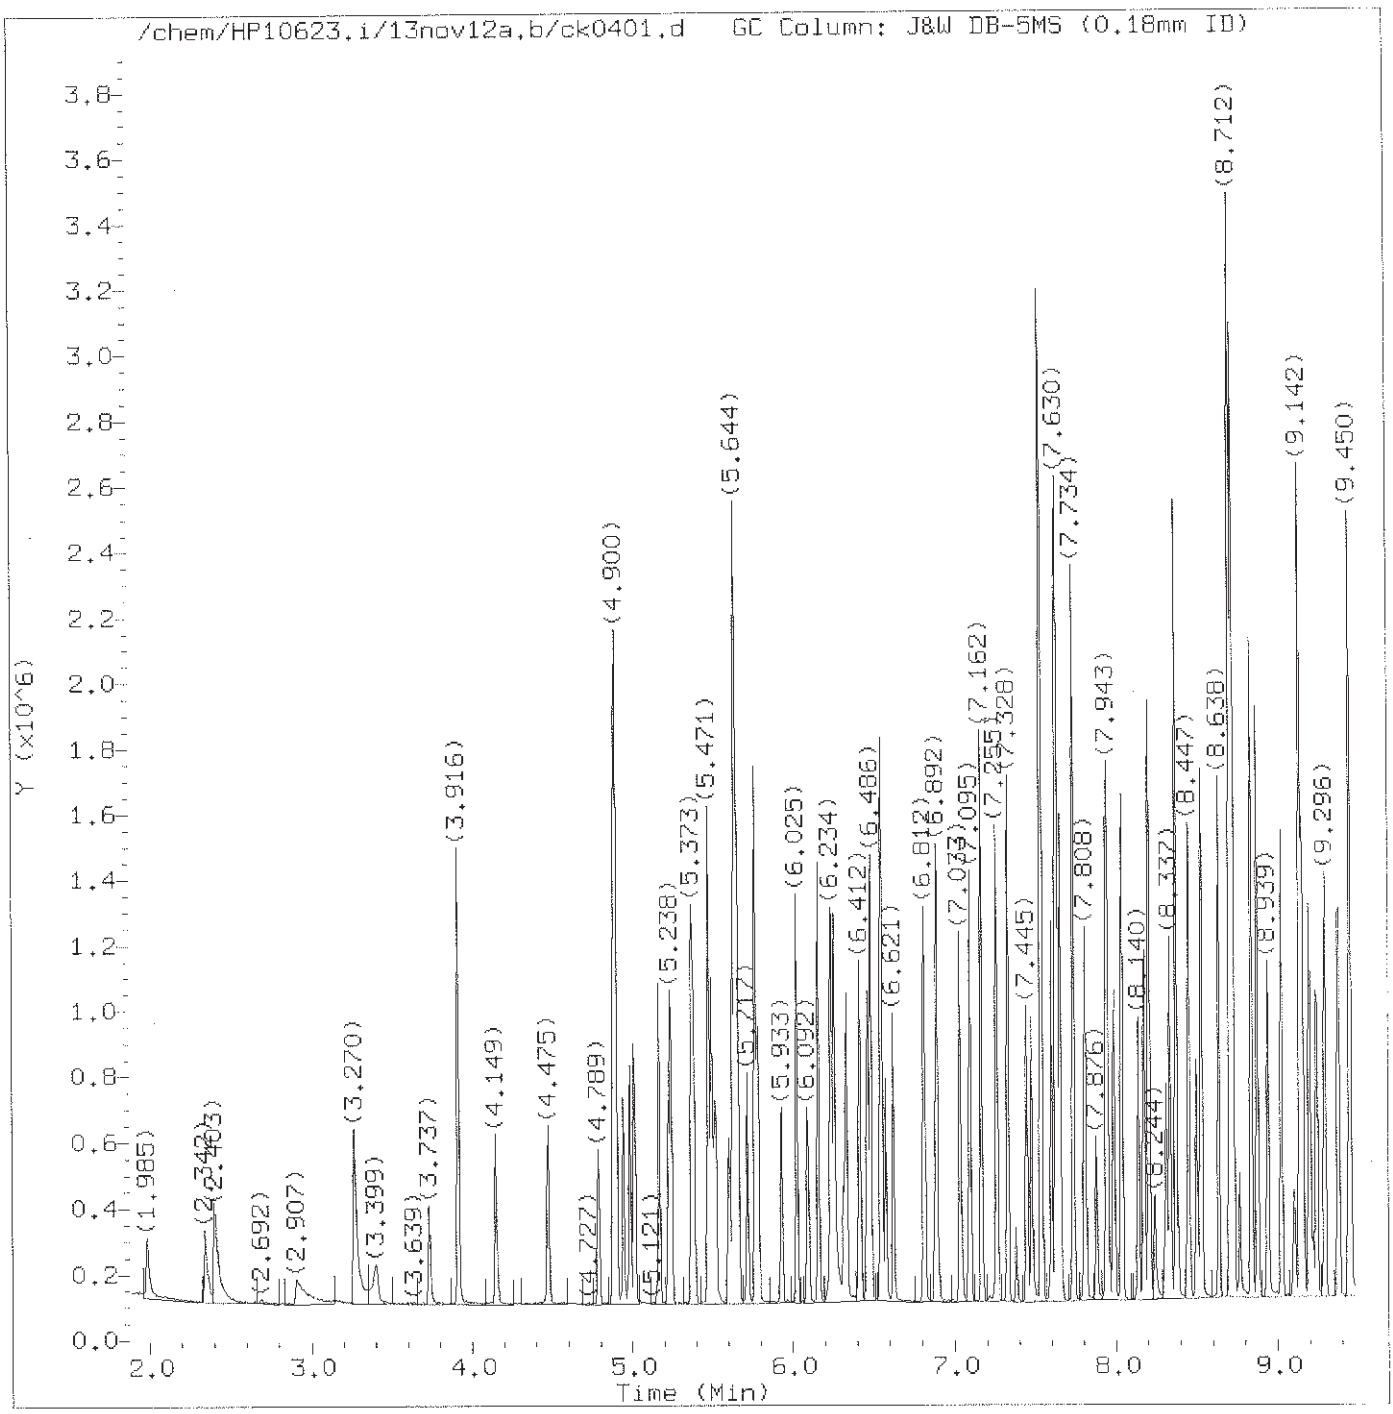
Benzidine EICP peak height = 1069531 EICP peak height at 10% = 106953 Benzidine EICP area = 682611



Benzidine EICP peak apex (min.) = 4.766
RT at 10% of front half of EICP (min.) = 4.756
RT at 10% of back half of EICP (min.) = 4.776

'Front' peak width (min.) = 0.0098333333
'Tailing' peak width (min.) = 0.0101166667

$$\text{Benzidine tailing factor} = \frac{\text{'Tailing' peak width (min.)}}{\text{'Front' peak width (min.)}} = \frac{0.0101166667}{0.0098333333} = 1.029$$



Assessment of GC Column Performance and Injection Port Inertness for

Instrument ID: HP10623.i Injection Date: 12-NOV-2013 09:23 Operator: jmg00346

$$\%\ 4,4'\text{-DDT breakdown} = \frac{4,4'\text{-DDE TIC area} + 4,4'\text{-DDD TIC area}}{4,4'\text{-DDE TIC area} + 4,4'\text{-DDD TIC area} + 4,4'\text{-DDT TIC area}} \times 100$$

$$\%\ 4,4'\text{-DDT breakdown} = \frac{0 + 0}{0 + 0 + 1650105} \times 100 = 0.0$$

Injection date and time: 12-NOV-2013 13:52 Analyst ID: jmg00346

Method used: /chem/HP10623.i/13nov12a.b/m8270.m Sublist used: newicval11
Calibration date and time: 13-NOV-2013 01:24
Date, time and analyst ID of latest file update: 13-Nov-2013 01:24 mac00013

Sample Name: SSTD050 Lab Sample ID: 8270ICV2463

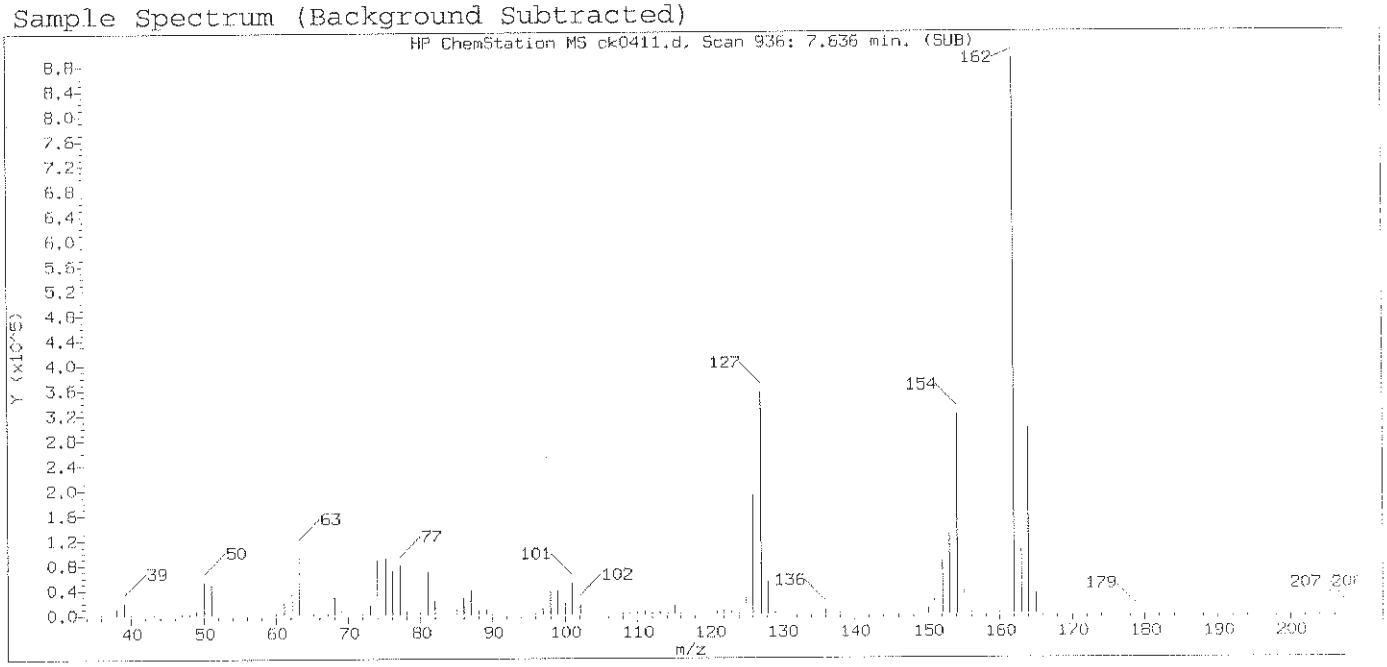
Compound Number	: 84		
Compound Name	: 2-Chloronaphthalene		
Scan Number	: 936		
Retention Time (minutes)	: 7.636		
Quant Ion	: 162.00		
Area (flag)	: 909334M		
On-Column Amount (ng/ul)	: 58.7790		
Integration start scan	: 932	Integration stop scan:	937
Y at integration start	: -854	Y at integration end:	-854



Reason for manual integration: improper integration

Analyst responsible for change: Digitally signed by Mark A. Clark
