Quality Control Summary

Client Name: Ashland, Inc. Group Number: 1412311
Reported: 09/03/13 at 09:33 AM

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J - estimated value – The result is ≥ the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers

A	TIC is a possible aldol-condensation product
B	Analyte was also detected in the blank
C	Pesticide result confirmed by GC/MS
D	Compound quantitated on a diluted sample
E	Concentration exceeds the calibration range of the instrument
N	Presumptive evidence of a compound (TICs only)
P	Concentration difference between primary and confirmation columns >25%
U	Compound was not detected
X,Y,Z	Defined in case narrative

Inorganic Qualifiers

B	Value is <CRDL, but ≥IDL
E	Estimated due to interference
M	Duplicate injection precision not met
N	Spike sample not within control limits
S	Method of standard additions (MSA) used for calculation
U	Compound was not detected
W	Post digestion spike out of control limits
*****	Duplicate analysis not within control limits
+	Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

The holding time was not met. Per client request, the sample was reextracted after the holding time had already expired.

Reporting limits were raised due to interference from the sample matrix.

Wet Chemistry	**SM 2540 G-1997**		%	%	%	
00111	Moisture	n.a.	23.7	0.50	0.50	1

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.

General Sample Comments

State of New Jersey Lab Certification No. PA011
This sample was originally submitted to the laboratory on 08/17/13 at 09:55. We received authorization for further testing on 10/08/13.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Quality Control Summary

Client Name: Ashland, Inc. Group Number: 1424644
Reported: 10/18/13 at 02:31 PM

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J - estimated value – The result is ≥ the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers		Inorganic Qualifiers	
A	TIC is a possible aldol-condensation product	**B**	Value is <CRDL, but ≥IDL
B	Analyte was also detected in the blank	**E**	Estimated due to interference
C	Pesticide result confirmed by GC/MS	**M**	Duplicate injection precision not met
D	Compound quantitated on a diluted sample	**N**	Spike sample not within control limits
E	Concentration exceeds the calibration range of the instrument	**S**	Method of standard additions (MSA) used for calculation
N	Presumptive evidence of a compound (TICs only)	**U**	Compound was not detected
P	Concentration difference between primary and confirmation columns >25%	**W**	Post digestion spike out of control limits
U	Compound was not detected	*****	Duplicate analysis not within control limits
X,Y,Z	Defined in case narrative	**+**	Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as “analyze immediately” are not performed within 15 minutes.

Quality Control Summary

Client Name: Ashland, Inc. Group Number: 1418744
Reported: 09/25/13 at 03:16 PM

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J - estimated value – The result is ≥ the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers

A	TIC is a possible aldol-condensation product
B	Analyte was also detected in the blank
C	Pesticide result confirmed by GC/MS
D	Compound quantitated on a diluted sample
E	Concentration exceeds the calibration range of the instrument
N	Presumptive evidence of a compound (TICs only)
P	Concentration difference between primary and confirmation columns >25%
U	Compound was not detected
X,Y,Z	Defined in case narrative

Inorganic Qualifiers

B	Value is <CRDL, but ≥IDL
E	Estimated due to interference
M	Duplicate injection precision not met
N	Spike sample not within control limits
S	Method of standard additions (MSA) used for calculation
U	Compound was not detected
W	Post digestion spike out of control limits
*****	Duplicate analysis not within control limits
+	Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. Executive Summary

Hercules LLC (Hercules), an indirect, wholly-owned subsidiary of Ashland Global Holdings Inc., performed a field pilot study to evaluate an ex-situ remedial technology to address 2,4,6-trinitrotoulene (TNT) at the former Kenvil Works Facility in Kenvil, New Jersey (the Facility). Selection of the ex-situ technology, bioremediation, was based on a multiyear remedial technology evaluation performed by Hercules. Pilot study objectives included evaluating the cost, effectiveness, and scalability of the remedial technology to determine its applicability for full-scale implementation and identify any improvements that could prove beneficial.

Hercules' initial studies related to TNT and its breakdown products identified native microbial communities in soil and groundwater at the Facility capable of degrading constituent mass. These studies identified source mass reduction in soil as a critical element of a comprehensive TNT Area remedy reliant upon natural attenuation to address groundwater.

Remedial technology evaluations and bench-scale treatability studies identified a combination of ex-situ processes to remove TNT mass from soil. The approach relies on enhancing the native microbial communities to biodegrade TNT and its breakdown products. The conceptual remedy involves soil preparation to reduce TNT grain size and increase surface area to volume ratio, followed by amendment addition to stimulate biodegradation.

This pilot study explored enhanced biodegradation techniques, comparing low-bulking composting with wood mulch (10 percent by volume) and a commercially-available amendment (PeroxyChem's DARAMEND OE® at 2, 3, and 4 percent by weight). The influences of amendment amount, dosing regime (incremental versus one time), and periodic redistribution via mixing, were evaluated.

The soil preparation process proved effective at generating a feed material having the targeted grain size distribution (i.e., $\leq$2mm) to facilitate amendment contact with soil. Study findings providing specific information necessary to optimize the preparation process, spatial requirements, and material handling best practices during design of a full-scale system.

The pilot study demonstrated the effectiveness of bioremediation using DARAMEND OE® to degrade TNT and breakdown products in soil to, or below, cleanup goals in a single field season. The low-bulking compost approach demonstrated an ability to degrade TNT; however, the degradation did not achieve target cleanup goals within a reasonable timeframe (single field season).

Specifically, pilot study results indicate the following:

- The addition of coarse cellulose (wood mulch) did not reduced TNT concentrations in soil to at or below its NRDCSRS, RDCSRS, and IGWSSL within the study period.

- The degradation rates observed over the study period in coarse cellulose trials are insufficient to support a single season remedial effort.

- The addition of DARAMEND OE® reduced TNT concentrations in soil to below its NRDCSRS in each of the DARAMEND OE® trials within the study period.

- The addition of DARAMEND OE® reduced concentrations of TNT, DNTs, and ADNTs in soil to below their respective RDCSRS in the 3 and 4 percent single and cyclical dose trials.

- The addition of DARAMEND OE® reduced concentrations of DNTs in soil to below their respective IGWSSL in the 3 and 4 percent single and cyclical dose trials.

- TNT and ADNT concentrations remained at least one order of magnitude greater than their respective IGWSSL and will be a focal point of the remedial strategy.

- On average, TNT concentrations were reduced by 99 percent in each DARAMEND OE® trial

- Both cyclical and single dose approaches were effective at reducing TNT concentrations to below the NRDCSRS. Soil conditions in the study boxes remained reducing at the end of the study period, and provided more time, further reductions of target constituent concentrations would be expected to occur.

- Soil turnover is not necessary to maintain degradation after the addition of DARAMEND OE®. No substantial differences were noted between single and cyclical turning regimes.

- While both approaches proved effective in reducing target constituent mass, the single dose approach appears more efficient with regards to both time (days to achieve success criteria) and effort (labor) relative to the cyclical dosing method.

- Remedial objectives for the Facility (i.e., reduce TNT, DNT, and ADNT concentrations to at or below NRDCSRS and RDCSRS) could be achieved in a single field season using DARAMEND OE®.

The following table summarizes pilot study findings.

SUMMARY OF FINDINGS *TNT Soil Bioremediation Pilot Study*	DARAMEND OE®			Low-Bulk Composting		
	TNT	DNTs	ADNTs	TNT	DNTs	ADNTs
Effectiveness						
≤NRDCSRS	Y	Y	Y	N	N	N
≤RDCSRS	Y	Y	Y	N	N	N
≤IGWSSL	N	Y	N	N	N	N
Implementability						
Current Site	Y			N		
W/ Modifications	---			Y		
Cost						
Site Preparation	$$			$$$		
$ Amendment/Ton Soil	$60/ton			$10/ton		
No. of Seasons	4-5			10+		

Based on the multiyear study of remedial alternatives and the results of this pilot study, enhanced bioremediation of TNT and breakdown products in Facility soil using DARAMEND OE® at a 3 percent by weight application rate represents the most cost-effective, efficient, and readily-implementable approach.

TNT soil bioremediation is a mass reduction component of a comprehensive remedy for soil and groundwater in the TNT Area. Residual constituent mass (i.e., concentrations greater than IGWSSLs) will be addressed via the lasting effects of the amendment in soil (i.e., DARAMEND OE® continues to support biological breakdown for approximately 5 years). Natural attenuation by native microbial communities will continue following the effective timeframe of DARAMEND OE® and will be the final remedy for soil and groundwater.

1. Introduction

Hercules LLC (Hercules), an indirect, wholly-owned subsidiary of Ashland Global Holdings Inc., performed a field pilot study to evaluate an ex-situ remedial technology to address 2,4,6-trinitrotoulene (TNT) at the former Kenvil Works Facility in Kenvil, New Jersey (the Facility). The ex-situ technology selected in this effort is based on a multiyear remedial technology evaluation performed by Hercules. The purpose of this pilot study was to field verify at reduced scale a safe and cost effective soil remedial technology to address TNT, 2,4/2,6-dinitrotoluene (DNT), and their breakdown products. The objective was to evaluate the cost, effectiveness, and scalability of the remedial technology to determine its applicability for full-scale implementation and identify any improvements that could prove beneficial.

1.1 Overview and Background

Historic process upsets and thermal decontamination of the manufacturing facility in the 1970's introduced solid-phase, crystalline TNT, and to a lesser degree DNT, to the soil surface and shallow subsurface in the former TNT manufacturing area (TNT Area) at the Facility. Subsequent erosion and redeposition of site soils following precipitation events redistributed the TNT, DNT and their breakdown products in the shallow subsurface soil within defined portions of the TNT Area. These soluble materials represent an ongoing source to groundwater. The site and remedial investigations identified TNT and its breakdown products in TNT Area soil and groundwater in the southwestern corner of the Facility.

Hercules studied microbial degradation of TNT and its breakdown products in groundwater in support of a monitored natural attenuation remedy. The findings of those studies indicated that biological breakdown facilitated by the native microbial community was occurring, and identified source mass removal/reduction in soil as a critical element of a comprehensive TNT Area remedy reliant upon natural attenuation to address groundwater.

A bench scale TNT soil separation treatability study conducted in 2013 evaluated the effectiveness of separating solid-phase, crystalline TNT from TNT Area soil. The objective was to determine if it was possible to remove the crystalline TNT from Facility soils so that it could be shipped off-site for destruction with the intention of allowing natural attenuation to address residual soil concentrations. The study results indicated that physical separation processes effectively segregated soil particles by grain size, allowed removal of large crystalline TNT particles, and concentrated residual energetic material in the finer grained fractions (ART & Arcadis, 2013). The study effectively removed TNT from gravel and larger sized soils (i.e., grain size greater than 2 millimeters [mm] in diameter) and concentrated fine TNT particles in the sand and smaller sized soils (grain size less than 2 mm in diameter). The majority of the Facility soils are comprised of poorly sorted glacially derived sediments, and thus the fine

fraction (less than 2 mm diameter) constitutes a large fraction of the soils (up to 65 percent). As such, physical separation remedy was not considered a viable, cost effective remedial technology and was not evaluated further. However, building upon the information gained in this study the following efforts began to evaluate the chemical/biological treatment of TNT and its breakdown products as a key component of the remedial strategy.

With the knowledge that physical processes alone could not achieve the New Jersey Department of Environmental Protection (NJDEP) remediation standards, and that offsite destruction would be very costly, the next phase of the treatability study evaluated chemical oxidation using Fenton's reagent to reduce concentrations of TNT and its breakdown products. The chemical oxidation step achieved the stated objectives; however, an evaluation of full-scale implementation identified the following two conditions that would render the technology undesirable for field implementation:

- Chemical oxidation would consume a substantial quantity of bulk chemicals (i.e., concentrated hydrogen peroxide), requiring an extensive regulatory permitting effort to authorize their storage and use at the Facility.
- Reagent contact occurred in a soil slurry (~15 percent solids), this process required a large volume of water that would require offsite disposal or additional onsite treatment.

Bioremediation is an established remedial technology and has been used by the US Department of Defense (DoD) on a number of TNT remedial projects. Bioremediation enhances and accelerates the biological reduction of nitro-based energetics in soils through anaerobic degradation. A variety of techniques can be used to achieve and maintain soil conditions that facilitate bioremediation; land farming and/or composting represent low-tech options amenable to large field scale implementation. Accelerated breakdown can also be achieved via the addition of commercially-formulated mixtures to enhance specific reactions.

A review of bioremediation scientific literature, DoD reports, and discussions with Alan Seech, Ph.D. of PeroxyChem identified PeroxyChem's DARAMEND OE®[1] as a proven, readily-available amendment that would provide a high probability of achieving the Facility's remedial objectives. DARAMEND OE® is typically blended with soil at a

[1] DARAMEND OE® is a commercially-available soil amendment that integrates slow-released carbon and nutrients with zero-valent iron to stimulate the native microorganisms and degrade organic constituents (PeroxyChem website). Oxygen is consumed in soil via the stimulation of native microorganisms, creating strong reducing (anaerobic) conditions. Zero-valent iron serves as an oxygen scavenger, furthering the anaerobic conditions and yielding redox potential as low as -600 millivolts (mV). DARAMEND OE® is typically added at 0.5 to 5 percent by weight, resulting in minimal soil bulking without altering the physical properties of the soil being treated.

rate of 0.5 to 5 percent by weight to treat TNT and other organic explosives; this low bulking factor also aligns with the Facility's goal of soil reuse onsite.

Previous pilot and full-scale remediation efforts conducted by PeroxyChem at DoD facilities demonstrated that DARAMEND OE® was capable of degrading organic explosives at source area concentrations in Facility soil. DARAMEND OE® has demonstrated reductions of TNT concentrations in soil from greater than 40,000,000 micrograms per kilogram (µg/kg) to less than 10,000 µg/kg. An evaluation of mass distribution of TNT and its breakdown products identified average concentrations of approximately 9,000,000 µg/kg TNT and approximately 1,500,000 µg/kg DNT in TNT Area source areas.

Based on this information, the concept of physical separation was changed to a physical preparation process to prepare the soil (removing soil aggregates over 2 mm in diameter and reducing TNT particles as small as practicable) and maximize the effectiveness of biological degradation. The physical processes (i.e., crushing and sieving) involved in soil preparation will be addressed in a separate document. As such, the pilot study focused on evaluating the effectiveness of DARAMEND OE® alongside other degradation-enhancing amendments (i.e., wood mulch) over the course of a single field season (April to October) in a soil fraction similar to that generated by a full-scale physical preparation process (i.e., less than 2 mm diameter).

The remainder of this document outlines the specific objectives and methods of the study, provides technical details on study implementation, and presents the results of the study.

2. Bioremediation Pilot Study Objectives

The remedial objective is to reduce concentrations of TNT and its breakdown products in soil to concentrations that are below applicable regulatory standards (i.e., NJDEP's Non-Residential and Residential Direct Contact Soil Remediation Standards [NRDCSRS and RDCSRS], and NJDEP's Default and/or Facility-specific Impact to Groundwater Soil Screening Levels [IGWSSL]) and reduce future partitioning to groundwater so that a natural attenuation remedy is appropriate for addressing groundwater in the TNT Area.

To meet this objective, the bioremediation pilot study focused on evaluating:

- The effectiveness of DARAMEND OE® to treat TNT and breakdown products (i.e., DNTs and aminodinitrotoluenes [ADNTs]) in Facility soil

- The influence of different amendment amounts, physical activity levels, and treatment durations needed to effectively reduce TNT concentrations in one field season

- The differences between coarse cellulose composting with wood mulch and treatment via DARAMEND OE®, as both are proven technologies to address TNT in soils employed by the DoD.

2.1 Critical Questions

The pilot study was designed to answer critical questions in the soil bioremediation process specific to the Facility. Answers to these questions will inform additional study and/or design of the full-scale remedy. A number of questions were formulated in the Work Plan and further refined during implementation of the pilot study.

Critical questions include:

- Will DARAMEND OE® enhance degradation of TNT and breakdown product mass in Facility soil to concentrations at or below regulatory standards?

- Will coarse organic matter (i.e., wood mulch) enhance degradation of TNT and breakdown product mass in Facility soil to concentrations at or below regulatory standards?

- Does soil turnover improve degradation rates and efficiency?

- What type of water management is required to maintain soil water content at 80 to 90 percent of water holding capacity?

- How does varying the amount of DARAMEND OE® amendment on a weight/weight (w/w) basis influence TNT degradation?

- Is DARAMEND OE® amendment more effective if added in a single dose at the beginning of the study period or incrementally throughout the study period?

- Will any breakdown products be formed, and remain present, during the process that may influence groundwater quality once the material is returned to excavation site? If so, are they products currently found in groundwater beneath the TNT Area, and how does their persistence and/or toxicity compare to that of TNT?

- Is it more cost effective to use a larger volume of wood mulch at a low unit cost than smaller volume of DARAMEND OE® at a higher unit cost?

- What is an estimated remedial cost per ton of soil?

2.2 Study Variables

Consideration of the objectives and critical questions above identified two primary variables requiring Facility-specific study:

1) Amount of amendment necessary

2) Soil management effort

In combination, these variables have the greatest potential to influence the ability to achieve the remedial goals in a single field season. Optimizing these variables directly relates to potential full-scale implementation, where DARAMEND OE® would represent a large capital cost, composting amendments would generate large material volume increases, and the overall volume of material (TNT soil with amendment) undergoing treatment would require efficient bioremediation to complete the remedy in a reasonable timeframe.

Two approaches for treating soil with DARAMEND OE® have proven effective. The traditional approach involves the incremental introduction of DARAMEND OE® via cycles ranging from 7 to 21 days in length. At the end of each cycle, the soil is turned over and additional DARAMEND OE® introduced. The cumulative amount of DARAMEND OE® added across the cycles typically falls within the 0.5 to 5 percent range. Successful pilot and full-scale demonstrations of the traditional approach were conducted at Joliet Army Ammunition Plant (Illinois), Yorktown Naval Weapons Station (Virginia), Hawthorne Army Depot (Nevada), and Raritan Arsenal (New Jersey). Recent efforts at Tooele Army Depot demonstrated that a single dose treatment with minimal turnover proved as effective as the traditional incremental dosage and turn over approach.

The U.S. Army demonstrated the successful use of composting to treat TNT in soil during pilot studies and full-scale remediation at multiple facilities (Tooele Army Depot, Umatilla Army Depot, Joliet Army Ammunition Plant) (Biocycle, 2006). The composting remedies used a combination of nitrogenous and coarse bulking amendments in a mixture of 70 percent amendment to 30 percent soil. Other studies (In et al., 2007) using sewage sludge proved effective at ratios as low as 33 percent amendment to 67 percent soil.

The pilot study evaluated the effectiveness of both the traditional (incremental) and single dose DARAMEND OE® application methods using varying amounts of the amendment (2, 3, and 4 percent). The study coupled the evaluation of variables related to DARAMEND OE® with composting trials using coarse cellulose matter (i.e., wood mulch) in a low-bulking approach enabling soil reuse onsite and a series of control trials (i.e., no amendment).

3. Bioremediation Pilot Study Implementation

Bioremediation pilot study implementation occurred over the course of 5 months during summer/fall 2015. Site preparation and soil separation began in late June 2015 and concluded in mid-July 2015. Biological activity was monitored from mid-July until October of 2015.

The subsections below describe the chronological phases of work related to study implementation.

3.1 Work Area Preparation

The pilot study was carried out in an area approximately 250 feet by 100 feet in a former scrap material laydown area known as "30-acres" (C13-1) in the footprint of the existing TNT Area groundwater plume. Work surface preparation included clearing of vegetation, grading, placement of a geotextile fabric covered with a minimum of 6 inches of quarry process (QP) material, and installation of soil erosion controls (i.e., silt fence and hay bales) at the work area perimeter. Activities were conducted in compliance with the Soil Erosion and Sediment Control Plan approved by the Morris County Soil Conservation District (Attachment 1). Secondary containment vessels were set up on the work surface beneath/around the wetted process equipment.

Work area preparation also included the siting of eleven watertight, 12-cubic yard (cy), steel roll off containers (study boxes) in which the various treatment regimes were carried out over the course of the study. The study boxes were aligned side by side in an open area where they were subjected to generally the same environmental conditions (e.g., sun, wind, shade, precipitation). Each study box was slightly elevated at one end to facilitate reclamation of excess water that leached from the soil (e.g., after a precipitation event). A slotted PVC pipe with a diameter sufficient to accommodate a submersible pump was placed in the low corner of each study box.

3.2 Material Excavation

Material excavation focused on TNT Area source areas previously used to support the treatability study. Given the larger volume of material necessary to support the pilot study, study preparation considered Resource Conservation and Recovery Act (RCRA) regulations pertaining to the treatment of hazardous waste. Prior to excavation, in-situ material was characterized in accordance with an In-Situ Waste Characterization Plan (Arcadis, 2014), NJDEP Waste Classification Request Form (HWM-009) and the U.S. Environmental Protection Agency's (USEPA's) Six-Step Hazardous Waste Identification Flow Chart (per 40 CFR 261). Characterization aimed to classify in-situ material relative to 40CFR261.24 regulatory levels, such that in-situ materials with potentially hazardous characteristics were not disturbed during excavation. Characterization identified an area of soil with lead concentrations exceeding the

40CFR261.24 regulatory level; this area was excluded from the pilot study excavation plan. Attachment 2 presents the In-Situ Waste Characterization Memo (Arcadis, 2015); the memo includes the In-Situ Waste Characterization Plan as an appendix.

Treatability study results indicated that fines and sand (less than 2 mm) make up approximately 65 percent of the TNT Area source area soil targeted for excavation. The pilot study required approximately 98 cy of post-processed ($\leq$2 mm) soil (11 study boxes, 8 cy per box, 10 percent contingency). As such, approximately 250 cy of material was excavated and stockpiled in the work area to support the pilot study.

3.3 Soil Preparation

ART Engineering LLC designed a multi-step system that combined oversized (>2 inch) dry screening with wet screening to isolate the $\leq$2 mm soil fraction supporting the study. This system was procured, assembled and tested at ART's facility prior to shipment to the Facility. Upon reaching the Facility, the soil preparation system was assembled on the work surface within secondary containment (where appropriate). Additional support equipment (e.g., generator) was rented locally. A NJ-licensed electrician was onsite to make the appropriate electrical connections. The Facility's water supply wells provided process water. Truck-mounted tanks were used to transfer water from a hydrant to various tanks staged in the work area.

Appendix A provides a layout diagram of the pilot scale soil preparation plant. Appendix B presents a soil preparation process flow sheet and mass balance diagram. A photograph log documenting the soil separation and management process is included as Appendix C.

Prior to soil preparation, PeroxyChem's soil laboratory in Ontario, Canada tested a composite soil sample collected from the excavation areas to evaluate the potential influence of the soil's geochemical properties on the pH of process water and soil moisture, and the ability of DARAMEND OE® to establish strong reducing conditions in a potentially low pH (less than 5) environment. The tests indicated that strong reducing conditions could be rapidly achieved. ART and PeroxyChem discussed pH adjustment during the wetted separation process and agreed that a pH adjustment step would minimize pH-related concerns and increase the potential for success via the elimination of an unknown/variable. To this end, the project team maintained process water pH levels between 6.5 and 7.2 though out the preparation process via the additional of hydrated lime to the process water recirculation tank (Tank B). Process water contact with soil effectively raised feed material pH.

Following initial testing and production runs using the process outlined in Appendix B, the field team evaluated the effectiveness of the sand screw for transporting settled fines. The length of time it took for the fines to settle out precluded effective use of the sand screw. In response, the settled fines were pumped directly from the low end of

the sand screw (sump) to a study box for dewatering; while the sand screw was used to dewater and discharge the sand fraction into the same dewatering study box. Samples of the sand screw discharge (sand fraction), settled fines, and combined sand and fines fractions were collected and submitted to Eurofins Lancaster Laboratories, a NJ-certified lab located in Lancaster Pennsylvania (Eurofins), for analysis.

Analytical parameters included:

- Semivolatile Organic Compounds (SVOCs) via USEPA SW-846 8270C
- Nitroaromatics and Nitroamines via USEPA SW-846 8330
- Target Analyte List (TAL) Metals via USEPA SW-846 6010B
- Mercury via USEPA SW-846 7471A
- Total Organic Carbon (TOC) via Lloyd Kahn Method
- Grain size distribution via Sieve and Hydrometer

These data were used to evaluate the distribution of TNT among the two fractions (building on the treatability study data), and evaluate constituent heterogeneity (in combination with the baseline sampling conducted in each study box – see *Study Box Monitoring and Management* section below). Table 1 presents analytical results for these process samples.

Once in the dewatering study box, a submersible pump within a perforated casing was used to further dewater the feed material. Field trials indicated that manipulating the feed material in the dewatering study box with the excavator bucket expedited dewatering. Following dewatering, the material was moved via excavator bucket to one of eleven study boxes staged in the work area.

Using the process outlined above, the pilot plant generated 108 cy of feed material over the course of 10 days of operation. The feed material was evenly distributed among eleven study boxes to a depth of approximately 2.5 feet (~8 cy), with the remaining feed material staged in other study boxes for potential future study. Process water was collected and staged in process tanks for use during the monitoring and management phase of the study. Study boxes were dewatered to achieve a target moisture content and appearance. Water pumped from the study boxes was returned to the process water tank. Following completion of the soil preparation process, the pilot plant equipment was decontaminated, covered, and stored in the work area for future use during full-scale operation.

3.4 Study Box Monitoring and Management

Soil preparation generated eleven study boxes of feed material, each containing approximately 8 cy of material similar in physical and chemical composition and moisture content. Each of the study boxes (A through K) represented a unique

treatment regime as outlined in Table 2. The regimes represent combinations of variables (i.e., moisture, amendment, physical manipulation/turnover) facilitating evaluation of study objectives relative to established controls.

Prior to initiating the treatment regime in each study box, a baseline sampling event was conducted. The baseline sampling event collected four composite samples from each study box to establish baseline data for each study box as well as assess the variability of constituent concentrations and physical parameters within the feed material. Each container was visually divided into quadrants approximately 4-feet wide and 6-feet long. In-situ field measurements and soil samples for laboratory analysis were collected from four random locations and depths within each quadrant. In-situ field measurements were averaged to calculate a value for each quadrant. Soil samples from each quadrant were composited in the field resulting in four composite samples per study box and a total of 44 samples. This more rigorous baseline sampling protocol was also used at the end of the 4th treatment cycle (estimated timeframe for meeting RDCSRS targets) and at the end of the 6th cycle (end of active management study period).

A less rigorous approach was used to monitor interim progress at the end of the 1st, 2nd, and 3rd cycles, and at 30-days post study, focusing on TNT and its degradation products. Using this approach, the boxes were visually divided into four quadrants and a single discrete grab sample was collected from each quadrant. These grab samples were composited in the field and submitted for the laboratory as a single composite sample representative of that study box. One composite sample per box was collected for a total of eleven samples per sampling event.

Field measurements, collected using in-situ field probes, included:

- pH
- moisture (visual inspection)
- temperature (°C)
- redox potential / ORP (mV)

Discrete grab soil samples of approximate equal weight were collected using disposable acetate core tubes or plastic scoops from the same sample locations as in-situ measurements. The use of the core tubes enabled sample collection from representative depths within each box. Samples collected using cores were field composited to generate a sample representative of the quadrant (or study box) for laboratory analysis.

Laboratory analyses included:

- SVOCs via USEPA SW-846 8270C
- Nitroaromatics and Nitroamines via USEPA SW-846 8330
- TAL Metals via USEPA SW-846 6010B
- Mercury via USEPA SW-846 7471A
- TOC via Lloyd Kahn Method

Samples for laboratory analysis were sent via lab-provided courier service to Eurofins. Results reported for Methods 8270C and 8330 included tentatively identified compounds (TICs) and complete chromatograms to facilitate tracking of degradation products beyond those on the reported analyte lists. Table 3 presents baseline in-situ field measurements. Table 4 presents baseline sampling analytical results. Analytical data packages are presented as Attachment 3.

Field data, laboratory sample information and visual observations were recorded on field data sheets (Appendix D).

Following the baseline sampling event, each study box was prepared for its unique treatment regime. A small excavator incorporated solid amendments (i.e., DARAMEND OE® or hardwood mulch) into the study box soil. The required amount of amendment was placed on top of the soil in the study box and the articulating bucket arm of an excavator sequentially turned over the soil throughout the study box until the material was visually distributed throughout the soil. Throughout the study period, boxes were turned using the same effort based on minutes of mixing/box with the mini-excavator.

Biological degradation occurs within wetted interstitial space among soil particles. As such, soil moisture management is crucial to successful degradation. Early literature review and conversation with Dr. Seech indicated keeping the soil moist but not overly wet would be critical in the success of the bioremediation pilot study. Following the blending of amendments, the study boxes were watered/dewatered to between 80 and 90 percent of the soil's water holding capacity (WHC). The WHC was qualitatively evaluated using visual assessment of each study box. Dr. Seech instructed the project field lead to visually inspect each box ensuring appropriate moisture content when the soil surface "glistened, resembling oatmeal". A small amount of standing puddled water was considered acceptable but thicker layers of overlying water that may have been present following precipitation events were removed via submersible pump during the pilot study.

Table 2 summarizes the treatment regimes by study box. Treatment regimes included:

Control Trials

Study Box A – no amendment, no water management, turned over on Study Day 1

Study Box B – no amendment, maintained at 80 to 90 percent WHC, turned over on Study Day 1 and on Study Day 71 (after 5th cycle)

Study Box C – no amendment, maintained at 80 to 90 percent WHC, cyclical turnover (Study Days 1, 15, 29, 43, 57, and 71)

DARAMEND OE® – Cyclical Dosing Trials

Study Box D – DARAMEND OE® added incrementally at 4 percent by weight

Study Box E – DARAMEND OE® added incrementally at 3 percent by weight

Study Box F – DARAMEND OE® added incrementally at 2 percent by weight

Each study box was maintained at 80 to 90 percent WHC and turned over at the beginning of each cycle following application of amendment (Study Days 1, 15, 29, 57, and 71) and turned over without the application of amendment on Study Day 43.

DARAMEND OE® – Single Dosing Trials

Study Box G – DARAMEND OE® added at 4 percent by weight on Study Day 1

Study Box H – DARAMEND OE® added at 3 percent by weight on Study Day 1

Study Box I – DARAMEND OE® added at 2 percent by weight on Study Day 1

Each study box was maintained at 80 to 90 percent WHC and turned over on Study Day 1 to incorporate amendment and again on Study Day 71 (after 5th cycle).

Coarse Cellulose Composting Trials

Study Box J – Hardwood mulch added at 10 percent by volume on Study Day 1, maintained at 80 to 90 percent WHC, cyclical turnover (Study Days 1, 15, 29, 43, 57, and 71)

Study Box K – Hardwood mulch added at 10 percent by volume on Study Day 1, maintained at 80 to 90 percent WHC, turned over on Study Day 1 to incorporate amendment and again on Study Day 71 (after 5th cycle)

Active management of the study boxes continued for six 14-day cycles (84 days total) consistent with the scope and schedule defined in Table 5. Field measurements and samples for laboratory analysis were collected throughout the study period in accordance with Table 5. An additional sampling event occurred 30 days beyond the end of the sixth cycle (Study Day 114) to evaluate ongoing degradation without active management (i.e., turnover, WHC maintenance).

Tables 3 and 4 summarize field measurements (i.e., pH, redox potential, temperature, and soil moisture) and laboratory analytical data, respectively, generated during the pilot study. Data were uploaded to the Facility's EQuIS database. Analytical data packages are presented as Attachment 3.

4. Bioremediation Pilot Study Findings

Specific results from the pilot study are presented below in the context of the critical questions posed at the beginning of this document. Field measurements for pH, redox potential, temperature, and soil moisture are referred to inside this discussion and are included in Exhibit D for reference.

Tables 3, 4, and 6 present field and laboratory analytical results collected during the study period. Table 4 presents a summary of target constituent analytical results by treatment regime and percent attainment of associated remedial targets (i.e., NRDCSRS, RDCSRS, IGWSSL, and Facility-specific remediation goals provided by NJDEP). Table 6 presents a summary of all analytical data collected during the study. Figures 1 through 9 present a series of graphs illustrating the study results. These tables and figures are referenced accordingly in the discussion of the results that follows.

4.1 Results

4.1.1 Baseline Sampling Event

Baseline data for target constituents were collected from each study box prior to adding amendments. For the SW846 8330 E&E analysis, the project team expressed concerns to the laboratory staff regarding the potential presence of one or more crystalline TNT particles in the soil aliquot used for sample extraction. The parties agreed to extract from a larger sample aliquot than that for the standard extraction process specified in the laboratory's 8330 analytical procedure in an effort to reduce heterogeneity across the study boxes. The use of a larger sample aliquot un-expectedly led to an underestimation of the mass of 8330 analyte list target constituents (TNT and ADNTs) in the study boxes. This process was repeated on the samples collected following the end of the 1st cycle (Study Day 14). Upon recognition that the underestimation had occurred, the project team and analytical laboratory agreed to analyze the remainder of the study samples using the standard extraction technique for the 8330 analysis.

The Baseline and End of 1st Cycle data from the 8330 analysis were discarded based on the underestimation. In the absence of these data, and acknowledging the need for baseline data to evaluate effectiveness, time series values representing Study Boxes A, B and C were averaged to yield TNT and ADNT concentrations representative of the combined control dataset. These data were used as surrogate baseline values for tracking study performance. DNT analytical results from the SW846 Method 8270C analysis were not influenced by the 8330 extraction procedure issues, and thus study box-specific data exists and is used to track study performance associated with these constituents.

Average baseline concentrations of TNT and ADNTs are presented in Table 4 as well as below in comparison to NJDEP comparison criteria.

Baseline Data Summary					
	2,4,6-TNT	2,4-DNT	2,6-DNT	2-A-4,6-DNT	4-A-2,6-DNT
Average Concentration	2,170,833	908 – 2,850*	152 – 798*	27,009	33,787
NRDCSRS	95,000	3,000	3,000	61,000	61,000
RDCSRS	21,000	700	700	4,700	4,700
IGWSSL	200	700	500	400	300

* Study box specific data exists (Table 4), range of values shown

Values presented in micrograms per kilogram (µg/kg)

4.1.2 Control Trials (Study Boxes A through C)

Control trial treatment regimes are outlined in Section 3.4 and summarized in Table 2. Analytical results for control trials are presented in Table 4, and on Figures 1, 3, 4, 7, 8, and 9.

These results indicate stable concentrations of TNT, DNTs and ADNTs in each of the control boxes. Control boxes include a static control that was turned on Study Day 1, but not mixed again or watered during the study cycle (Box A), a control box where the WHC was maintained at approximately 85% and turned on Study Days 1 and 71 only (Box B) and a control box where WHC was maintained and the soil was turned cyclically on Study Days 1, 15, 29, 43, 57, and 71. Although the mixing frequency was different in the three boxes, TNT, DNT and ADNT concentrations remained stable and similar across the three controls. These results indicate that water management and mixing frequency variables alone do not substantially influence degradation of nitrotoluenes in soil.

4.1.3 Cyclical Dose DARAMEND OE® Trials (Study Boxes D through F)

Cyclical dose DARAMEND OE® treatment regimes are outlined in Section 3.4 and summarized in Table 2. Analytical results for cyclical dose trials are presented in Table 4, and on Figures 2, 3, 4, 7, 8, and 9. Results of cyclical dose trials are summarized in the following table.

DARAMEND OE® – Cyclical Dose Trail Results Summary					
Trial/Constituent		Total Concentration Reduction (%)	Final Concentration Less Than		
			NRDCSRS	RDCSRS	IGWSSL
Study Box D (4% w/w)	2,4,6-TNT	99	X	X	
	2,4-DNT	76	X*	X	X
	2,6-DNT	80	X*	X*	X
	2-A-4,6-DNT	91	X*	X	
	4-A-2,6-DNT	91	X*	X	
Study Box E (3% w/w)	2,4,6-TNT	99 (a)	X (a)		
	2,4-DNT	77	X*	X	X
	2,6-DNT	64	X*	X*	X
	2-A-4,6-DNT	86	X*	X	
	4-A-2,6-DNT	89	X*	X	
Study Box F (2% w/w)	2,4,6-TNT	99	X	X	
	2,4-DNT	62	X*		
	2,6-DNT	76	X*	X*	
	2-A-4,6-DNT	74	X*		
	4-A-2,6-DNT	75	X*		

(a) The TNT concentration increased by an order of magnitude between the end of the study and the 30-day post study sample period.

* Baseline concentration less than regulatory standard

These results indicate:

- Order(s) of magnitude decreases to TNT, DNT, and ADNT concentrations by the end of the study (Study Day 84).
- The 4 percent trial (Box D) provided the greatest reduction in TNT, DNT, and ADNT concentrations. Concentrations for each constituent were reduced below NRDCSRS and RDCSRS; and below IGWSSL for DNTs (Figure 2).
- Each cyclical dosing trial yielded TNT, DNT and ADNT concentrations less than their respective NRDCSRS at the end of the study period (Figures 2, 3, and 4).
- TNT degradation resulted in a transient increase in ADNT concentrations at the end of the second cycle (Study Day 28) in each trial (Boxes D, E, and F); however,

ADNTs degraded to concentrations less than NRDCSRS throughout the remainder of the study period (Figure 2 and Table 4).

- TNT, DNT and ADNT concentrations decreased to less than RDCSRS in the 4 percent trial (Box D), for all but TNT in the 3 percent trial (Box E), and for only TNT and 2,6-DNT in the 2 percent trial (Box F). Although the RDCSRS for TNT wasn't achieved in the 3 percent trial at the end of the study period, interim TNT monitoring results fell below the RDCSRS on two occasions (Table 4).

- DNT concentrations decreased to less than IGWSSL during the course of the study in each of the cyclical dose trials, with DNT concentrations at the end of the study period remaining below IGWSSL for all but 2,4-DNT in the 3 percent trial (Box F). 2,4-DNT concentrations decreased by an order of magnitude over the study period, while 2,6-DNT concentrations decreased between 80 percent (4 percent trial) and 60 percent (2 percent trial). TNT and ADNT concentrations also demonstrated order of magnitude reductions; however, TNT and ADNT concentrations at the end of the study period remained at least one order of magnitude greater than their corresponding IGWSSL.

4.1.4 Single Dose DARAMEND OE® Trials (Study Boxes G through I)

Single dose DARAMEND OE® treatment regimes are outlined in Section 3.4 and summarized in Table 2. Analytical results for single dose trials are presented in Table 4, and on Figures 3, 4, 5, 7, 8, and 9. Results of single dose trials are summarized in the following table.

DARAMEND OE® – Single Dose Trail Results Summary					
Trial/Constituent		Total Concentration Reduction (%)	Final Concentration Less Than		
			NRDCSRS	RDCSRS	IGWSSL
Study Box G (4% w/w)	2,4,6-TNT	99	X	X	
	2,4-DNT	82	X*	X	X
	2,6-DNT	84	X*	X	X
	2-A-4,6-DNT	89	X*	X	
	4-A-2,6-DNT	91	X*	X	
Study Box H (3% w/w)	2,4,6-TNT	99	X	X	
	2,4-DNT	75	X*	X	X
	2,6-DNT	58	X*	X*	X
	2-A-4,6-DNT	83	X*	X	
	4-A-2,6-DNT	83	X*		
Study Box I (2% w/w)	2,4,6-TNT	99	X		
	2,4-DNT	49	X*		
	2,6-DNT	39	X*	X*	X*
	2-A-4,6-DNT	79	X*		
	4-A-2,6-DNT	73	X*		

* Baseline concentration less than regulatory standard

These results indicate:

- Order(s) of magnitude decreases in TNT, DNT, and ADNT concentrations by the end of the study (Study Day 84).

- The 4 percent trial (Box G) provided the greatest reduction in TNT, DNT, and ADNT concentrations. Concentrations for each constituent in this trial were reduced below NRDCSRS and RDCSRS; and below IGWSSL for DNTs (Figure 5).

- Single dose trials yielded TNT, DNT and ADNT concentrations less than their respective NRDCSRS at the end of the study period (Figures 3, 4, and 5).

- Target constituent concentrations were reduced to less than RDCSRS in the 4 percent trial (Box G), for all but 4-A-2,6-DNT in the 3 percent trial (Box H), and for 2,6-DNT only in the 2 percent trial (Box I, baseline 2,6-DNT concentration was less than RDCSRS).

- DNT concentrations were reduced to less than IGWSSL during the course of the study in each of the single dose trials, with the exception of 2,4-DNT in the 2 percent trial (Box I). 2,4-DNT concentrations decreased by an order of magnitude over the study period, while 2,6-DNT concentrations decreased between 80 percent (4 percent trial) and 40 percent (2 percent trial). TNT and ADNT concentrations demonstrated similar order of magnitude reductions; however, TNT and ADNT concentrations at the end of the study period remained at least one order of magnitude greater than their corresponding IGWSSL.

- TNT degradation resulted in a transient increase in ADNT concentrations at the end of the second cycle (Study Day 28) in the 3 and 2 percent trials (Boxes H and I); while ADNT concentrations decreased throughout the study period in the 4 percent trial (Box G). Although ADNTs were likely generated in the 4 percent single dose trial (Box G), an increase in concentration is not observed suggesting the ADNTs were degraded at a rate similar to their production.

- The reduction in concentration was slower in the 2 percent trial (Box I) than the higher doses (Boxes G and H) with much of the reduction occurring after the box was turned over at Study Day 57. This suggests that the reduction reaction was limited by the amount of DARAMEND OE® in contact with soil grains and mixing improved contact. The concentration of TNT was reduced to below the NRDCSRS by Study Day 70. TNT remained present at a concentration slightly above the RDCSRS at the end of the study period.

4.1.5 Wood Mulch Trials (Study Boxes J and K)

Coarse cellulose composting treatment regimes are outlined in Section 3.4 and summarized in Table 2. Analytical results for coarse cellulose trials are presented in Table 4, and on Figures 3, 4, and 6. Results of the coarse cellulose trials are presented in the following table.

Coarse Cellulose Composting Trail Results Summary					
Trial/Constituent		Total Concentration Reduction (%)	Final Concentration Less Than		
			NRDCSRS	RDCSRS	IGWSSL
Study Box J (cyclical turn)	2,4,6-TNT	36			
	2,4-DNT	(84)	*		
	2,6-DNT	(551)	X*	*	*
	2-A-4,6-DNT	(33)	X*		
	4-A-2,6-DNT	(10)	X*		
Study Box K (single turn)	2,4,6-TNT	45			
	2,4-DNT	(64)	X*		
	2,6-DNT	(80)	X*	*	*
	2-A-4,6-DNT	(33)	X*		
	4-A-2,6-DNT	(69)	X*		

* Baseline concentration less than regulatory standard

These results indicate:

- TNT concentrations at the end of the study period demonstrated an overall decrease; however, results throughout the study period did not indicate a reducing trend, with concentrations increasing and decreasing sporadically throughout. Despite this variability, TNT concentrations remained orders of magnitude greater than the NRDCSRS at the end of the study period (Figure 6).

- DNT concentrations appear to increase over the duration of the study. This trend may be attributable to biological degradation of TNT yielding DNT and its resistance to further reduction in this trial.

- ADNT concentrations increased throughout much of the study period, indicating that biological degradation of TNT was occurring. The 30-day post-study sampling results (Study Day 114) indicated a decrease in ADNT concentrations (Table 4).

This decrease may indicate that both formation and subsequent degradation of ADNTs was underway. The duration of the study period, corresponding to a single field season, was insufficient to fully evaluate this potential trend.

4.1.6 Notable Observations

Notable observations beyond the data- and study box-specific findings noted above may be useful as they relate to decision making regarding large scale soil remediation, and include:

- DNT concentrations present in prepared soil were at or below the NRDCSRS at the beginning of the study period (as footnoted in the tables presented in Sections 4.1.3 through 4.1.5). Although some individual analytical samples had concentrations greater than NRDCSRS, as a whole, DNT concentrations remained at or below the NRDCSRS throughout the study period in each trial. DNT concentrations were reduced below their RDCSRS and IGWSSL in the 4 percent and 3 percent DARAMEND OE® trials (Study Boxes D, E, G, and H).

- ADNT concentrations present in prepared soil were at or below the NRDCSRS at the beginning of the study period (as footnoted in the tables presented in Sections 4.1.3 through 4.1.5). ADNT concentrations increased in most trials as TNT was biologically degraded to ADNTs. In the DARAMEND OE® trials, this increase in ADNTs was followed by their degradation (Study Boxes D, E, F, H, and I), with the exception of the 4 percent single dose trial (Box G), where no increase in ADNT concentrations was observed and both TNT and ADNT concentrations decreased in parallel (Table 4).

- Variability in analytical data should be considered when using sampling results for the attainment of success criteria. Heterogeneity of the soil mixture may be responsible for a portion of the variability in these results; with the incorporation of wood mulch likely exacerbating this effect. The physical manipulation of the material redistributes the crystalline solid throughout the mixture.

    - Order of magnitude differences in analytical results from subsamples sharing a common composite parent sample are well-documented in soil samples containing crystalline solid TNT (Crockett et al, 1998; Jenkins et al, 1998). These factors likely influenced study results. Variability among results within each trial is evident in the time-series datasets (Table 4), and believed to be an artifact of sample heterogeneity.

- Concentrations of lead increased consistently in soil treatments over time (Table 4). The average lead concentration from all boxes at the beginning of the study was ~124,000 µg/kg (range of 100,000 to 165,000 µg/kg) while the average concentration at the end of the study was ~241,000 µg/kg (range of 221,000 to

277,000 µg/kg). Although an increase in concentration was noted, soil lead concentrations remained below the RDCSRS of 400,000 µg/kg. It is unclear what caused this apparent increase in lead concentrations in soil.

4.2 Critical Questions

Will DARAMEND OE® enhance degradation of TNT and breakdown product mass in Facility soil to concentrations at or below regulatory standards?

- The addition of DARAMEND OE® reduced concentrations of TNT, DNTs, and ADNTs in soil to below their respective NRDCSRS in each of the DARAMEND OE® trials (2, 3, and 4 percent; cyclical and single dose).

- The addition of DARAMEND OE® reduced concentrations of TNT, DNTs, and ADNTs in soil to below their respective RDCSRS in the 4 percent single and cyclical dose trials.

- The addition of DARAMEND OE® reduced concentrations of DNTs in soil to below their respective IGWSSL in the 3 and 4 percent single and cyclical dose trials.

- TNT and ADNT concentrations remained at least one order of magnitude greater than their respective IGWSSL and will be a focal point of the remedial strategy.

- On average TNT concentrations were reduced by 99 percent in each DARAMEND OE® trial (Table 4); however, compliance will be evaluated against NJDEP's comparison criteria . Figures 7 through 9 illustrate the percent reduction efficiency for TNT and ADNTs, respectively.

Will coarse organic matter (i.e., wood mulch) enhance degradation of TNT and breakdown product mass in Facility soil to concentrations at or below regulatory standards?

- The addition of coarse cellulose did not reduced TNT concentrations in soil to at or below its NRDCSRS in either trial (cyclical and single turning) within the study period.

- DNT and ADNT concentrations generally increased through the early part of the study period as TNT degraded, with a decreasing trend towards the end of the study period. With the exception of 2,4-DNT, DNT and ADNT concentrations decreased to below their respective NRDCSRS in both trials by the end of the study period. However, DNT and ADNT baseline concentrations were also below NRDCSRS.

- The addition of coarse cellulose did not reduce TNT, DNT, and ADNT concentrations in soil to below their respective RDCSRS and IGWSSL within the study period.

- The degradation rates observed over the study period in coarse cellulose trials are insufficient to support a single season remedial effort.

Is soil turnover required to achieve degradation?

- Soil turnover is not necessary to maintain degradation after the addition of DARAMEND OE®. Decreasing TNT (and metabolite) concentrations and strong reducing conditions were noted in each study box where DARAMEND OE® was added. No substantial differences were noted between single and cyclical turning regimes (Table 2, 3b, 4).

- Soil turnover in the cyclical turn coarse cellulose trial resulted in weaker reducing conditions relative to the single turn trial. The stronger reducing conditions in the single turn trial probably facilitated degradation of TNT to ADNTs.

What type of water management is required to maintain soil water content at 80 to 90 percent of WHC?

- The field management of water in the study boxes demonstrated that maintaining the soil at the target WHC is achievable, and provided information useful in planning the full-scale remedy. During the study period (July 2016 to October 2016) soil moisture levels were maintained at 80 to 90 percent of the WHC. The soil in the study boxes was exposed to the elements (e.g., sun, wind, precipitation) and the field team added or removed water from the water-tight boxes in anticipation of and response to weather at the Facility. Observations and activities related moisture in each study box are presented in Appendix D.

- The inability for the study boxes to self-drain in response to precipitation events likely underestimated the frequency at which the boxes required the addition of water. Freely draining piles at full-scale will likely require more routine watering to maintain target moisture levels.
- The grain size distribution of the material (mixture of sands and silt) will allow water to freely drain through stockpiled material at full-scale and dictate the configuration of the soil treatment cell.

How does varying the amount of DARAMEND OE® amendment on a weight/weight (w/w) basis influence TNT degradation?

- TNT, DNT, and ADNT concentrations decreased to less than their NRDCSRS and RDCSRS in the 4 percent DARAMEND OE® cyclical and single turn trials during the study period (Table 4).

- TNT, DNT, and ADNT concentrations decreased to less than NRDCSRS, but did not consistently meet their respective RDCSRS in the 3 percent and 2 percent DARAMEND OE® trials during the study period (Table 4). Decreasing trends approaching the RDCSRS were observed in these trials.

- DNT concentrations decreased to less than their IGWSSL in the 4 percent and 3 percent DARAMEND OE® trials during the study period (Table 4). Decreasing trends were observed in the 2 percent trials.

- TNT and ADNT concentrations remained order(s) of magnitude greater than their IGWSSL in each DARAMEND OE® trial.

- Overall, the higher percentage DARAMEND OE® trials demonstrated more rapid and complete degradation of TNT, DNT, and ADNTs.

Is DARAMEND OE® *more effective if added in a single dose at the beginning of the study or incrementally throughout the study period?*

- Both cyclical and single dose approaches were effective at reducing TNT concentrations to below the NRDCSRS. Soil conditions in the study boxes remained reducing at the end of the study period, and provided more time, further reductions of target constituent concentrations would be expected to occur.

- Redox measurements were collected in-situ at the end of each cycle. No differences in reducing conditions were noted between boxes that were stirred only once versus boxes that were stirred at each cycle.

- The 4 percent single dose trial was the only trial that did not generate ADNT concentrations greater than NRDCSRS during the TNT degradation process. The 4 percent cyclical dose trial, as well as the 3 percent cyclical and single dose trials, demonstrated an increase in ADNT concentrations at the end of the first cycle. These concentrations decreased to ranges similar to those observed in the 4 percent single dose trial through the remainder of the study period.

- While both approaches proved effective in reducing target constituent mass, the single dose approach appears more efficient with regards to both time (days to achieve success criteria) and effort (labor) relative to the cyclical dosing method.

Will any breakdown byproducts be formed, and remain present, during the process that may influence groundwater quality?

- Degradation of ADNTs to diaminonitrotoluenes (DANTs) and triaminotoluenes (TATs) likely occurred, although these breakdown products

were not part of the analytical monitoring suite and are not regulated by NJDEP or USEPA. Ahmad and Hughes (2000) document these biodegradation pathways and products. Samples will be collected from the most successful trials and will be evaluated for DANTs and TATs.

- Laboratory chromatograms from pilot study soil samples were reviewed to evaluate the potential presence and degradation of intermediary breakdown products not included in a standard list of analytes. The results of the chromatogram evaluation did not identify any accumulation of breakdown products that would alter the conclusions of this study. Long chain fatty acids were identified in the chromatogram review indicating some degree of complete degradation is occurring.

Is it more cost effective to use a larger volume of wood mulch at a low unit cost than smaller volume of DARAMEND OE® at a higher unit cost?

Coarse Cellulose

- While raw material costs per unit (T) are lower for coarse cellulose, the apparent timeframe for degradation will last longer than a single field season and overall costs are similar to DARAMEND OE®.

- The low-bulking (10 percent [v/v]) wood mulch approach proved unsuccessful at meeting NJDEP remediation goals in the study period, with signs that degradation may occur over a longer timeframe.

- Traditional composting studies targeting TNT in soil have relied on amendment percentages ranging from 33 to 70 percent by volume. Increasing wood mulch volumes to this range would increase material costs by a factor of 4 to 7 times and require management (or disposal) of the excess material that would not fit back in the excavation.

- As evaluated in the pilot study (10 percent v/v), the unit cost using coarse cellulose is $10 per ton of soil. Using traditional composting studies (33 to 70 percent compost), unit costs range from $33 to $70 per ton of soil. Unit costs are for amendment only and based on 100,000 tons of soil requiring treatment.

- Additional factors include: larger infrastructure (e.g., laydown and staging pads); bulk wood mulch sourcing, procurement and delivery; and longer management and monitoring periods.

DARAMEND OE®

- The pilot study demonstrated the effectiveness of DARAMEND OE® at a 3 percent (w/w) application rate to achieve remedial goals within a single field season.

- Existing facility infrastructure is capable of storing a single field season's worth of DARAMEND OE® within former warehouses.

- Unit cost using DARAMEND OE® is $60 per ton of soil. Unit cost is for amendment only and based on a 3 percent application rate and 100,000 tons of soil requiring treatment.

5. Conclusions and Recommendations

5.1 Conclusions

The bioremediation pilot study proved that the overall remedial objectives for the Facility (i.e., reduce TNT, DNT, and ADNT concentrations to at or below NRDCSRS and RDCSRS) could be achieved in a single field season using DARAMEND OE®. Low bulking coarse cellulose composting (10 percent compost) demonstrated an ability to degrade TNT; however, multiple field seasons (years) would be required to achieve remedial objectives. Traditional composting approaches with the demonstrated ability to degrade TNT over a single field season (33 to 70 percent compost) are similar in cost to DARAMEND OE®.

The addition of DARAMEND OE® reduced concentrations of TNT and breakdown products in soil to below the remedial objectives for the Facility (NRDCSRS/RDCSRS). The more stringent RDCSRS values were met for TNT and breakdown products where DARAMEND OE® was added at 4 percent, and expected to be met at 3 percent, using cyclical or single dosing approaches. The 2 percent DARAMEND OE® trials did not consistently achieve concentrations below the RDCSRS. Although the IGWSSL values were not met for TNT or ADNTs in any trial, the addition of DARAMEND OE® was effective in reducing concentrations of DNTs to below the IGWSSL values in 3 and 4 percent trials. Given the solubility and mobility of DNTs this is an important finding when considering the full-scale remedy.

Time required to achieve the remedial objective varied depending on the amendment dosage and amount of physical mixing applied in each treatment. Treatments that generated strong reducing conditions supported greater TNT and metabolite removal. Reducing conditions, and a reduction in mass, were achieved faster in treatments where the total target amendment amount was added at the beginning of the study. However, cyclical addition of amendment yielded similar end of study results. Adding DARAMEND OE® in a large dose at the beginning of the study also reduced the resources necessary to incrementally add amendment and mix the material over the course of the study.

TNT soil bioremediation is a mass reduction component of a comprehensive remedy for soil and groundwater in the TNT Area. Residual constituent mass (i.e., concentrations greater than IGWSSLs) will be addressed via the lasting effects of the amendment in soil (i.e., DARAMEND OE® continues to support biological breakdown for approximately 5 years). Natural attenuation by native microbial communities will continue following the effective timeframe of DARAMEND OE® and will be the final remedy for soil and groundwater.

5.2 Future Considerations

Results of the field study provide valuable insight to inform the remedial design for bioremediation of TNT soil at the Facility. The DARAMEND OE® approaches evaluated are scalable to full-scale. Pilot study findings called attention to a number of additional considerations at full-scale beyond the effectiveness and efficiency of DARAMEND OE®. These considerations include:

Material handling and management – The slurried feed material reduces mechanical handling effort and may prove to be an efficient means of transporting material from the processing area to the soil treatment cell. Draining water from the slurried material will be required to attain target WHC in the field, and will necessitate consideration of leachate management as part of full-scale design. Collected leachate can be used to irrigate the soil treatment cell to maintain target WHC and enhance the microbial communities in treated soil.

Material processing – Amendment distribution and feed material homogeneity are critical aspects of achieving expected results at full-scale and merit attention during design. The heterogeneous mixture achieved using the excavator bucket in the pilot study was effective; however, improvements can be made at full scale that would result in more homogenous blending and less effort. The soil preparation process should minimize the size of crystalline TNT particles present in soil to maximize the effectiveness of the amendment and microbial degradation.

Regulatory Interpretation – A detailed review of the historic process will be performed to evaluate if any of the residual TNT could be classified as a K047 listed hazardous waste that would require additional permitting during full-scale implementation of the remedy. Areas of interest include a potential former settling pond (B13-1) and gravel pit (B13-2) that may have been used as a settling pond.

Non-target constituents – Treatability and pilot work have focused primarily on a target suite of E&E constituents and, to a lesser degree, lead. A cursory evaluation of the fate of lead and other comingled non-target constituents (e.g., pyrogenic polycyclic aromatic hydrocarbons) was conducted as part of this pilot study data evaluation. These non-target constituents were sporadically detected; and with few exceptions, concentrations detected were below NJDEP remedial standards (i.e., NRDCSRS, RDCSRS, IGWSSL). The full-scale remedial design should address the possibility of encountering areas of soil containing non-target constituents exceeding NJDEP remedial standards and its potential effect on reuse of treated material to the excavation area.

Analytical laboratory data – Analytical data will be the primary means of demonstrating attainment of remedial goals at full scale. To this end, accurate and precise analytical laboratory data is critical. The management of elements discussed above (e.g., mixture

heterogeneity, crystalline TNT particle size) should improve consistency of sampled material. Further, technical planning discussions with the analytical laboratory provide a means of standardizing the analytical approach to reduce variability.

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

Notes:
NJDEP = New Jersey Department of Environmental Protectior
SRS = Soil Remediation Standarc
NA = Not analyzed
NS = No screening level available
U = Constituent not detected, assoicated value is laboratory detection limi
J = Estimated concentration
ug/kg = Microgram per kilogram
Bold indicates a concentration above Residential SRS
Bold and Shade indicates a concentration above Non-residential SRS

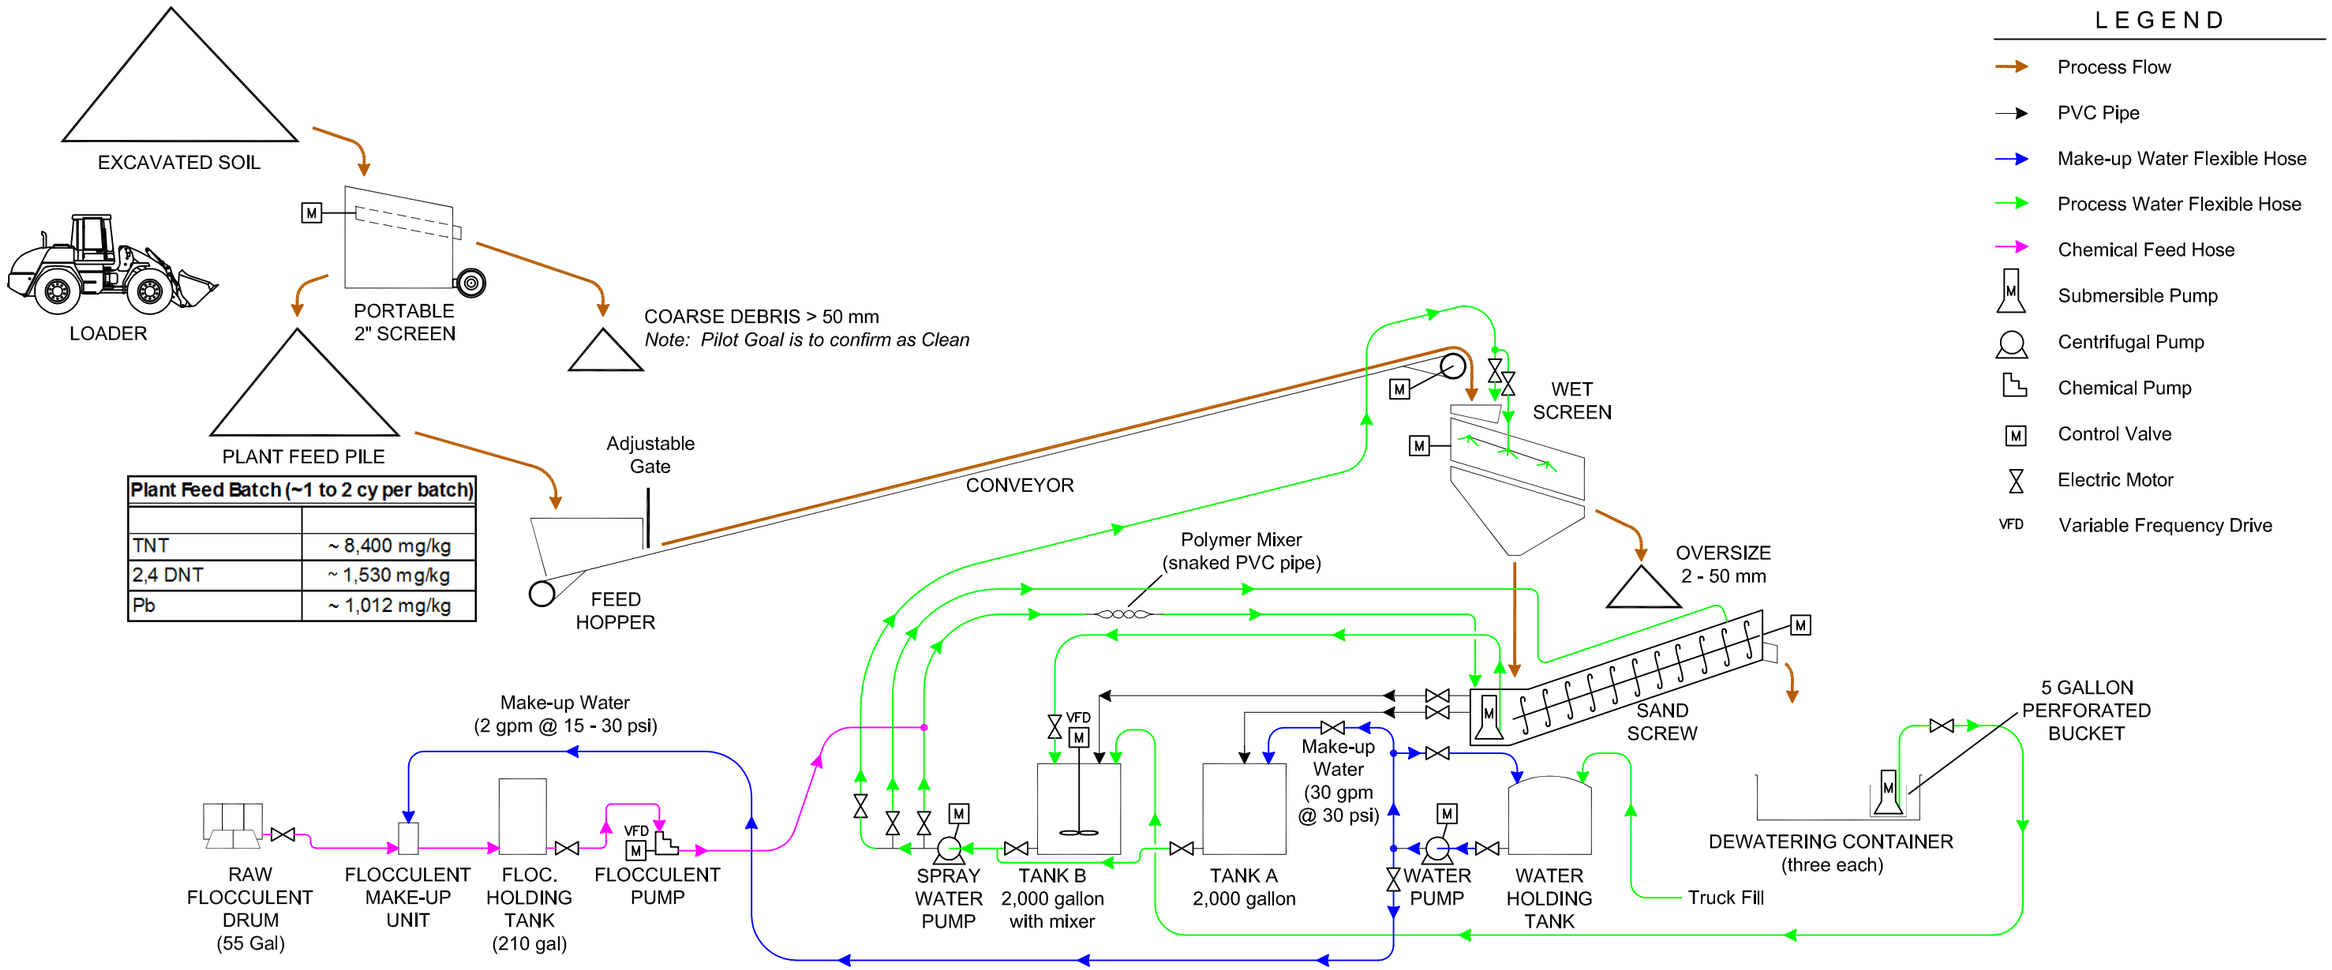
Process Flow and Mass Balance Diagram



Plant Feed Batch (~1 to 2 cy per batch)	
TNT	~ 8,400 mg/kg
2,4 DNT	~ 1,530 mg/kg
Pb	~ 1,012 mg/kg

LEGEND

- Process Flow
- PVC Pipe
- Make-up Water Flexible Hose
- Process Water Flexible Hose
- Chemical Feed Hose
- M — Submersible Pump
- Centrifugal Pump
- Chemical Pump
- M — Control Valve
- Electric Motor
- VFD — Variable Frequency Drive

Cycle Time Estimation

Feed Cycle Time	15 min
Flocculation Cycle Time	15 min
Settling & Decantation Time	15 min
Empty out & Prep Time	15 min
Total Estimated Time per Batch	60 min

Batch Design Details

Batch Size	1.8	cy
Density	1.4	ton/cy (estimate)
Feed (moist)	2.52	tons
Feed Moisture	15%	by weight (estimate)
Feed (dry)	2.14	tons
Oversize 2-50 mm	0.64	tons dry
Sand & Fines	1.50	tons dry
Moisture Product	40%	by weight (estimate)
Sand & Fines Product	2.50	tons moist
Density	1.3	ton/cy (estimate)
Sand & Fines product	1.9	cy moist

Soil Particle Size Parameters

Oversize 2-50 mm	30%		input
Sand 0.105 - 2.0 mm	40%		input
Fines < 0.105 mm	30%		input
Total (=100%)	**100%**		

Water Balance Design

Target Slurry Density	8%	solids by weight	input
Total mass of fines (<0.105 mm)	0.6	tons	calc
Total water mass	8.0	tons	calc
Total water volume	1932	gallons	calc
"Feed Cycle" Time	15	minutes	input
Flowrate to wet screen	129	gpm	calc
Soil Conveyor Feed Rate	10	tph	calc

NJ007000.NJ70

Dear Mr. Dunn:

On behalf of Hercules Incorporated (Hercules), a wholly-owned subsidiary of Ashland Incorporated, ARCADIS U.S., Inc, (ARCADIS) has prepared the enclosed application for a Soil Erosion and Sediment Control Plan (SESCP) Certification for the Kenvil Works Facility (the Facility) located in Kenvil[1], Morris County, New Jersey. This SESCP application addresses a bioremediation pilot study (pilot study) associated with a former manufacturing area (project area) of the Facility. These activities will result in soil surface disturbances that require compliance with New Jersey Administrative Code 2:90 - Standards for Soil Erosion and Sediment Control in New Jersey.

This letter provides an overview of the Facility and proposed pilot study activities, and presents the soil erosion and sediment control measures proposed to address disturbances. The following items supplement the information provided in this letter and are included as part of this application for SESCP Certification:

- Completed SESCP application and application fees (ARCADIS check no. 162366, in the amount of $1,100, calculated using the proposed disturbance of approximately 1.5 acres of Category D land).

[1] Kenvil is an unincorporated community within Roxbury Township

- Ownership Disclosure Affidavit
- SESCP drawings (1 x set of 4 figures; Figure 1 through 4)

BACKGROUND

The Facility occupies 1,200 acres along Howard Boulevard, about 0.5 miles northwest of the center of Kenvil, Morris County, New Jersey (Figure 1). Pilot study activities will occupy a small area (approximately 65,678 square feet [1.5 acres]) within Block 6701, Lot 1 in Roxbury Township.

Approximately 800 acres of the Facility supported former manufacturing operations. The remaining 400 acres are undeveloped areas between process units and around the perimeter of the Facility; these undeveloped areas acted as buffers between the former active portions of the Facility and the surrounding community. The project area is located in the southwest corner of the Facility and includes a work area, three material source areas, and access routes between them for the transport of materials. This area represents one of the earliest developed portions of the Facility with manufacturing operations beginning operation in 1871. During this long operational history site related materials inadvertently escaped the manufacturing buildings and require remediation. As part of this study bioremediation is being evaluated as a possible remedial option and will be tested at the pilot scale. . Figure 2 provides a Site Plan of the project area that includes current site features and discusses the general scope of work (i.e. vegetation clearing, excavation, soil separation, soil segregation, and soil stockpiling). The results of pilot study activities addressed in this SESCP application will inform future remedial efforts within this area.

BIOREMEDIATION PILOT STUDY ACTIVITIES

Pilot study activities include the following:

- Vegetation clearing and grubbing, and surface cover improvements within work area (Figure 2)

- Soil excavation from the source areas

- Soil processing and stockpiling for the pilot study within the work area.

Pilot study activities will be conducted within upland areas throughout the project area (Figure 2). Vegetation clearing is anticipated to be minimal and limited predominantly to herbaceous grasses, and occasional shrubs and saplings. No trees will be removed as a part of vegetation clearing activities. Vegetation clearing will be minimized wherever possible.

To minimize disturbances, existing paved and gravel roadways will be used for worker access within the project area. In absence of paved roadways to the excavation areas, areas will be accessed using a front-end loader with pneumatic tires. Unimproved roadways capable of supporting heavy equipment exist throughout the work area and will be used whenever possible. The number of trips between the work area and excavation areas will be minimized. Temporary disturbance to vegetation will be minimal, with no long term affects expected.

A flat work surface will be constructed to support soil separation equipment and heavy machinery, as well as soil stockpiling for the duration of the pilot study. The ground surface will be graded and covered with a non-woven geotextile fabric. Approximately six inches of sand and one foot of stone (3/4 inch, clean) will be placed over the geotextile to provide a stable working surface. The work surface will be permeable allowing precipitation to drain and thus not create any stormwater runoff. Figure 3 presents the location of the work area and Figure 4 presents details of the work area surface.

Soil will be excavated to depths up to 3 feet below ground surface (bgs) using a front end loader from discrete locations. Excavated soil (approximately 150 cubic yards [cy]) will be transported via front-end loader to the work area and stockpiled. Stockpiled soil will be screened in the work area to remove material greater than 2 inches. The <2 inch fraction will remain stockpiled in the work area, while the oversized material will be returned to the excavations. Stockpiled material will be covered with plastic tarps when not in use.

A pilot-scale physical soil separation plant will be used to generate bioremediation feed material needed to support the pilot study. The soil separation process will use a closed loop water system that contains approximately 4,000 gallons of water. Following soil separation, process water will be contained in tanks onsite and used as a source of irrigation water to maintain the bioremediation test piles at an appropriate moisture level for optimal biodegradation to occur. .

The pilot study will consist of 11 soil treatments which will each consist of an 8 cy soil pile. Each pile will be placed in its own 11 cy steel, open-top, roll-off container. The roll-off containers effectively segregate the soil from the work area surface and contain any runoff. Soil and water in each roll off box will be contained during the duration of the study.

The pilot test will be terminated at the end of a 12 week treatment. Pile monitoring will continue at 30, 60, and 120 days beyond the end of the treatment period to evaluate degradation progress of residuals without pile management. Following the completion of bioremediation activities, treated soils that have constituent concentrations less than New Jersey Department of Environmental Protection's (NJDEP's) Non-Residential Direct Contact Soil Remediation Standards (NRDCSRS) and Impact to Groundwater Soil Remediation Standards (IGWSRS) will be returned to the excavation areas and compacted in 2-foot lifts. Soil that has constituent concentrations greater than NRDCSRS or IGWSRS will remain in the work area and undergo additional treatment to facilitate reuse. Excess stockpiled material may remain covered within the work area for the duration of the study to support additional testing in 2016.

At the conclusion of the study, the equipment will be demobilized and/or stored in structures onsite. Ground surface improvements in the work area will remain in place to support future pilot test activities.

SOIL EROSION AND SEDIMENT CONTROL MEASURES

The proposed SESC measures within the project area and soil excavation areas are presented on Figure 3. To mitigate potential for soil erosion and transport, silt fence with wattles and/or strawbales/haybales will be placed around the work area and each excavation. After the pilot study is completed, each source area will be backfilled with the treated material. All disturbed areas will be seeded and mulched at the conclusion of the bioremediation activities.

Figure 3 presents the SESCP and notes for the project area. Soil erosion and sediment control concerns identified for this project will be addressed by the following measures:

- The weather conditions will be monitored on a daily basis. Construction activities will be planned and sequenced to avoid disturbing soil when significant rainfall is occurring or is imminent.

- The soil excavation areas have mild-medium slopes, and the work area is flat, with minimal or no elevation change. Primary sources of hydrology to the project area are precipitation, and surface flow from adjacent upland areas. No stormwater drainage inlets are present within the project area.

- Soil erosion from the work area and each excavation area will be controlled by wattles and/or silt fence and straw bales placed around each area as shown in Figure 3. The details of the control measures to be used on the project are presented on the SESCP drawings (Figure 4).

- Additional wattles/and or silt fence will be placed around any material piles not contained in a roll-off container for the duration of the pilot study.

- Care will be taken to ensure all soil remains within each container during turning and watering that will occur at regular intervals.

- Roll-off containers will be de-watered after heavy rain events using a submersible pump. Any reclaimed water will be returned to the process water tank for use as irrigation water.

- Soil erosion and sediment control measures will be inspected on a routine basis. Required maintenance that results from these routine inspections will be performed as soon as practical. Perimeter controls (wattles, strawbales/haybales, silt fence, etc.) will be maintained for the entire duration of the bioremediation activities.

SCHEDULE AND CONSTRUCTION SEQUENCE

Contingent upon receiving applicable permits required to conduct the field work, ARCADIS intends to initiate mobilization and implementation of the proposed work on June 15, 2015. ARCADIS will notify Morris County Soil Conservation District 72-hours prior to initiation of land disturbances. The proposed sequence of activities is as follows:

1. Mobilize equipment to Facility and install wattles/silt fence around the work area as shown on Figure 3
2. Clear vegetation
3. Work surface construction (i.e., grading, geotextile fabric installation, stone cover) in the work area

4. Source area excavation and initial size screening
5. Soil separation and segregation
6. Soil stockpiling in roll-off containers for the duration of the pilot test
7. Return soils to source areas
8. Site cleanup and demobilization.

These activities will occur between June 1 and October 30, 2015. Should additional bioremediation testing be necessary, material may remain in the field on the work surface through spring and summer of 2016. SESC measures will be maintained until the study materials and equipment are demobilized from the work area.

Adverse weather has the potential to impact this schedule. Should these conditions occur, the Morris County Soil Conservation District will be notified of the delays and will be provided a revised anticipated completion date. Any soil erosion and sediment control installed during the above-listed activities will remain in-place until the proposed pilot study activities have been completed.

Please review the enclosed application and support documents. If you have any questions or require clarification of the information included with this submission, please contact me at (484) 688-0378.

Sincerely,

ARCADIS U.S., Inc.

James McLaughlin

APPENDIX A2

REQUIREMENTS, GUIDELINES AND PROCEDURES FOR
PREPARING AND IMPLEMENTING "STANDARDS FOR SOIL EROSION AND
SEDIMENT CONTROL IN NEW JERSEY"

An application for certification of a soil erosion and sediment control plan shall include the following items.

1. One copy of the complete subdivision, site plan or construction permit application, including key map as submitted to the municipality (Architectural drawings and building plans and specifications not required.) which includes the following:
   a. Location of present and proposed drains and culverts with their discharge capacities and velocities and support computations and identification of conditions below outlets.
   b. Delineation of any area subject to flooding from the 100-year storm in compliance with the Flood Plains Act (NJSA 58:16A) or applicable municipal zoning.
   c. Delineating of streams, wetlands, pursuant to NJSA 13:9B and other significant natural features within the project area.
   d. Soils and other natural resource information used. (Delineation of the project site on soil map is desirable utilizing the USDA Web Soil Survey.)
   e. Land cover and use of area adjacent to the land disturbance.
   f. All hydraulic and hydrologic data, describing existing and proposed watershed conditions and HEC HMS, HEC RAS, TR-55 and similar models, and other electronic input files, if used, of existing and proposed conditions and a completed copy of the Hydraulic and Hydrologic Data Base Summary Form, SSCC 251 HDF1.

2. Up to four copies of the soil erosion and sediment control plan* at the same scale as the site plan submitted to the municipality or other land use approval agency to include the following: (This information shall be detailed on the plat)
   a. Proposed sequence of development including duration of each phase in the sequence.
   b. Site grading plan showing delineation of land areas to be disturbed including proposed cut and fill areas together with existing and proposed profiles of these areas (an interim grading-erosion control plan may be required for large sites with extensive cuts and fills).
   c. Contours at a two foot (or smaller) interval, showing present and proposed ground elevation.
   d. Locations of all streams and existing and proposed drains and culverts.
   e. Stability analysis of areas below all points of stormwater discharge which demonstrates a stable condition will exist or there will be no degradation of the existing condition.
   f. Location and detail of all proposed erosion and sediment control structures including profiles, cross sections, appropriate notes, and supporting computations.
   g. Location and detail of all proposed nonstructural methods of soil stabilization including types and rates of lime, fertilizer, seed, and mulch to be applied.
   h. Control measures for non-growing season stabilization of exposed areas where the establishment of vegetation is planned as the final control measure.
   i. For residential development - control measures to apply to dwelling construction on individual lots and notation that such control measures shall apply to subsequent owners if title is conveyed. This notation shall be shown on the final plat.
   j. Plans with a notation for maintenance of permanent soil erosion and sediment control measures and facilities during and after construction, also indicating who shall have responsibility for such maintenance.

Appropriate fees. (As adopted by the individual district.)

Additional items as may be required.

*Individual districts may require modifications in the above list.

New Jersey Natural Resources Conservation Program

For District Use Only

APPLICATION FOR SOIL EROSION AND SEDIMENT CONTROL PLAN CERTIFICATION

The enclosed soil erosion and sediment control plan and supporting information are submitted for certification pursuant to the Soil Erosion and Sediment Control Act, Chapter 251, P.L. 1975 as amended (NJSA 4:24-39 et. seq.) An application for certification of a soil erosion and sediment control plan shall include the items listed on the reverse side of this form.

Name of Project: Kenvil Works Facility		Project Location: Municipality: Kenvil, Township of Roxbury	
Project Street Address: 100 Howard Boulevard		Block: 6701	Lot: 1
Project Owner(s) Name: Hercules Incorporated c/o Ed Meeks		Email: edmeeks@ashland.com	Phone #: 302-995-3433 Fax #:
Project Owner(s) Street Address (No P.O. Box Numbers): 500 Hercules Road, Building 8139/7		City: Wilmington	State: DE Zip: 19808
Total Area of Project (Acres)	Total Area or Land to be Disturbed (Acres): 1.1	No. Dwelling or other Units: NA	Fee: $ 1,100
Plans Prepared by*: Gary M. Wroblewski, P.E.			Phone #: 609.860.0590 Fax #: 609.860.0491
Street Address: 8 South River Road		City: Cranbury	State: NJ Zip: 08512

*(Engineering related items of the Soil Erosion and Sediment Control Plan **MUST** be prepared by or under the direction of and be sealed by a Professional Engineer or Architect licensed in the State of New Jersey, in accordance with NJAC 13:27-6.1 et. seq.)

Agent Responsible During Construction: ARCADIS U.S., Inc.			Email:
Street Address: 8 South River Road			
City: Cranbury	State: NJ	Zip: 08512	Phone: 609.860.0590 Fax #: 609.860.0491

The applicant hereby certifies that all soil erosion and sediment control measures are designed in accordance with current **Standards for Soil Erosion and Sediment Control In New Jersey** and will be installed in accordance with those Standards and the plan as approved by the Soil Conservation District and agrees as follows:

1. To notify the District in writing at least 48 hours in advance of any land disturbance activity. Failure to provide such notification may result in additional inspection fees.
2. To notify the District upon completion of the Project (Note: No certificate of occupancy can be granted until a report of compliance is issued by the District.
3. To maintain a copy of the certified plan on the project site during construction.
4. To allow District agents to go upon project lands for inspection.
5. That any conveyance of this project or portion thereof prior to its completion will transfer full responsibility for compliance with the certified plan to any subsequent owners.
6. To comply with all terms and conditions of this application and certified plan including payment of all fees prescribed by the district fee schedule hereby incorporated by reference.

The applicant hereby acknowledges that structural measures contained in the Soil Erosion and Sediment Control Plan are reviewed for adequacy to reduce offsite soil erosion and sedimentation and not for adequacy of structural design. The applicant shall retain full responsibility for any damages which may result from any construction activity notwithstanding district certification of the subject soil erosion and sediment control plan. It is understood that approval of the plan submitted with this application shall be valid only for the duration of the initial project approval granted by the municipality. All municipal renewals of this project will require submission and approval by the district. In no case shall the approval extend beyond three and one half years at which time resubmission and certification will be required. Soil Erosion and Sediment Control Plan certification is limited to the controls specified in the plan. It is not authorization to engage in the proposed land use unless such use has been previously approved by the municipality or other controlling agency. It is further understood that all documents, site plans, design reports etc. submitted to the district shall be made available to the public (upon request) pursuant to the Open Public Records Act, N.J.S.A. 47:1A-1 et seq.

1. Applicant Certification* Signature: [signature] Date: 5/27/15 Applicant Name (Print) Edward D Meeks	3. Plan determined complete: Signature of District Official: _____ Date: _____
2. Receipt of fee, plan and supporting documents is hereby acknowledged: Signature of District Official: _____ Date: _____	4. Plan certified, denied or other actions noted above. Special Remarks: Signature of District Official: _____ Date: _____

***If other than project owner, written authorization of owner must be attached.**

SOIL CONSERVATION DISTRICT
ADDENDUM TO APPLICATION

APPLICATION BY CORPORATION, PARTNERSHIP OR ORGANIZATION

OWNERSHIP DISCLOSURE AFFIDAVIT

Soil Conservation District requests that all applicants submit a complete list of ownership for purposes of determining conflicts of interest between the applicant and the board of members or their professionals. Attach Rider if necessary.

Disclosure of owners of organization and property subject to application. Any organization making an application for development under this act shall list the names and addresses of all members, stockholders, or individual partners (collectively, "interest holders"), including any other organization holding at least a 10% ownership interest in the organization, and shall also identify the owner of the property subject to the application, including any organization holding at least a 10% ownership interest in the property.

Listing of names and addresses of interest holders of applicant and owner organization.
If an organization owns an interest equivalent to 10% or more of another organization , subject to the disclosure requirements hereinabove described, that organization shall list the names and addresses of its interest holders holding 10% or greater interest in the organization.

Disclosure of all officers and trustees of a non-profit organization. A non -profit organization filing an application of development under this act shall list the names and addresses of all officers and trustees of the non-profit organization.

This disclosure requirement is continuing during the Certification period and transfer of ownership of more than 10% must be disclosed.

Organization or non-profit organization failing to disclose: fine. Any organization or non-profit organization failing to disclose in accordance with this act shall be subject to a fine of $1,000 to $10,000, which shall be recoverable in the name of the municipality in any court of record in the State in a summary manner pursuant to the "Penalty Enforcement Law" (N.J.S.A. 2A:58-1 et seq.)

Name and Address of Applicant:

Hercules Incorporated
500 Hercules Road, Building 8139/7

- WETLAND FLAG LOCATION
- EXCAVATION/MATERIAL SOURCE AREAS
- WORK AREA (STAGING/LAYDOWN)
- WATTLES AND/OR SILT FENCE AND STRAW BALE

NOTES:

1. PROPOSED SCOPE OF WORK INCLUDES TNT RESIDUAL SOIL BIOREMEDIATION PILOT STUDY ACTIVITIES. VEGETATION CLEARING TEMPORARY EXCAVATIONS, SOIL SEPARATION, AND STOCKPILING WILL BE CONDUCTED AS PART OF THE ACTIVITIES.
2. ALL SOIL-RELATED WORK WILL BE CONDUCTED IN ACCORDANCE WITH THE N.J.A.C. 2:90 STANDARDS FOR SOIL EROSION AND SEDIMENT CONTROL IN NEW JERSEY. EVERY EFFORT SHALL BE MADE TO PREVENT EROSION OR SPREADING OF DISTURBED MATERIAL. SOIL DISTURBANCE ACTIVITIES WILL BE AVOIDED DURING SIGNIFICANT RAINSTORM.
3. SURFACE COVER THROUGHOUT PROJECT AREA IS PREDOMINANTLY HERBACEOUS. NO TREES WILL BE DISTURBED AS PART OF THE VEGETATION CLEARING ACTIVITIES WITHIN THE SOURCE AREAS, TEMPORARY ACCESS ROUTES LOCATED OUTSIDE OF THE EXISTING PAVED ROADWAYS, AND WORK AREA. VEGETATION CLEARING WILL ONLY BE REQUIRED IN THE STAGING/LAYDOWN AREA.
4. TOTAL TEMPORARY DISTURBANCES WITHIN THE PROJECT AREA ARE APPROXIMATELY 50,000 SQ. FT./1.1 ACRE.
5. WETLAND BOUNDARIES WERE DELINEATED IN 2011 AND VERIFIED ON JANUARY 2. 2015 BY ARCADIS STAFF TRAINED IN WETLAND DELINEATION CONSISTENT WITH DEFINITIONS PROVIDED AT 33 CFR 328.3(A)(1-8), THE 1987/89 WETLAND MANUALS, AND THE 2012 REGIONAL SUPPLEMENT.
6. COORDINATE SYSTEM IS NEW JERSEY STATE PLAN NAD 83 (FEET).
7. WETLANDS DELINEATED WITHIN THE PROJECT AREA MEET THE DEFINITION OF EXCEPTIONAL RESOURCE VALUE WETLANDS, REQUIRING A 150-FOOT TRANSITION AREA.
8. JURISDICTIONAL BOUNDARIES SHALL BE CONSIDERED DRAFT UNTIL REVIEW AND APPROVAL BY NJDEP.

SOIL EROSION AND SEDIMENT CONTROL NOTES:

1. ALL SOIL EROSION AND SEDIMENT CONTROL PRACTICES WILL BE INSTALLED IN ACCORDANCE WITH THE N.J.A.C. 2:20 STANDARDS FOR SOIL EROSION AND SEDIMENT CONTROL IN NEW JERSEY, AND WILL BE IN PLACE PRIOR TO ANY MAJOR SOIL DISTURBANCE, OR IN THEIR PROPER SEQUENCE AND MAINTAINED UNTIL PERMANENT PROTECTION IS ESTABLISHED. AT LEAST 72 HOURS PRIOR TO ANY SOIL DISTURBANCE, NOTICE IN WRITING, SHALL BE GIVEN TO THE MORRIS COUNTY SOIL CONSERVATION DISTRICT AND A PRE–CONSTRUCTION MEETING SCHEDULED.
2. ALL DISTURBED AREAS WILL BE SEEDED AND MULCHED AT THE CONCLUSION OF PILOT STUDY ACTIVITIES.
3. PERMANENT VEGETATION IS TO BE ESTABLISHED ON EXPOSED AREAS WITHIN TEN (10) DAYS AFTER FINAL GRADING. MULCH IS TO BE USED FOR PROTECTION UNTIL VEGETATION IS ESTABLISHED. TNT CONCENTRATIONS IN SOIL IN PORTIONS OF THE PROJECT AREA PRECLUDE VEGETATIVE GROWTH.
4. IMMEDIATELY FOLLOWING INITIAL DISTURBANCE OR ROUGH GRADING, CRITICAL AREAS (STEEP SLOPES, SANDY SOILS, WET CONDITIONS) SUBJECT TO EROSION WILL BE SEEDED.
5. PERMANENT SEEDING AND STABILIZATION TO BE IN ACCORDANCE WITH THE "STANDARDS FOR PERMANENT VEGETATIVE COVER FOR SOIL STABILIZATION COVER".
6. THE SITE SHALL AT ALL TIMES BE GRADED AND MAINTAINED SO THAT STORMWATER RUNOFF IS DIVERTED TO SOIL EROSION AND SEDIMENT CONTROL FACILITIES.
7. ALL EROSION AND SEDIMENT CONTROL MEASURES WILL REMAIN IN PLACE THROUGHOUT THE DURATION OF THE PROJECT AND WILL BE INSPECTED WEEKLY AND AFTER EACH RAIN EVENT. MAINTENANCE/REPAIRS TO DAMAGED OR MALFUNCTIONING CONTROLS SHALL BE PERFORMED IMMEDIATELY UPON DISCOVERY. ENGINEER SHALL INSPECT AND APPROVE OF MAINTENANCE/REPAIRS PRIOR TO RESUMING WORK.
8. EXCAVATED SOIL WILL BE TEMPORARILY RELOCATED TO THE WORK AREA FOR SOIL SEPARATION AND STOCKPILING. SOILS WILL BE BACKFILLED INTO SOURCE AREA AFTER COMPLETION OF PILOT STUDY.
9. A STABILIZED CONSTRUCTION ACCESS WILL BE INSTALLED, WHENEVER AN EARTHEN ROAD INTERSECTS WITH A PAVED ROAD. SEE THE STABILIZED CONSTRUCTION ACCESS DETAIL AND CHART FOR DIMENSIONS.
10. PAVED ROADWAYS WILL BE KEPT CLEAN.
11. DEWATERING ACTIVITIES WILL BE CONDUCTED AS PART OF THE SOIL SEPARATION ACTIVITIES WITHIN THE WORK AREA. DEWATERING WILL OCCUR IN CONTAINMENT STRUCTURES. WATER REMOVED DUE TO DEWATERING ACTIVITIES WILL BE CONTAINERIZED IN PROCESS WATER TANKS FOR USE AS IRRIGATION WATER.
12. NO SEDIMENT BASINS ARE PRESENT AT THE SITE.
13. SOIL STOCKPILES WILL BE COVERED WITH TARPS AND SUPPLEMENTAL EROSION AND SEDIMENT CONTROL MEASURES SHALL BE INSTALLED AROUND THE PERIMETER OF SOIL STOCKPILES WITHIN THE WORK AREA TO PREVENT MIGRATION OF SEDIMENT.
14. LOCATION OF STABILIZED CONSTRUCTION ENTRANCES, ACCESS ROADS, AND WORK AREA, MAY BE MODIFIED AS NECESSARY AND WITH PRIOR APPROVAL BY THE ENGINEER, TO FACILITATE EXCAVATION AND STOCKPILING ACTIVITIES.

NOTES:

1. PROPOSED SCOPE OF WORK INCLUDES VEGETATION CLEARING, TEMPORARY EXCAVATIONS, SOIL SEPARATION, AND STOCKPILING.
2. ALL SOIL–RELATED WORK WILL BE CONDUCTED IN ACCORDANCE WITH THE N.J.A.C. 2:90 STANDARDS FOR SOIL EROSION AND SEDIMENT CONTROL IN NEW JERSEY. EVERY EFFORT SHALL BE MADE TO PREVENT EROSION OR SPREADING OF DISTURBED MATERIAL. SOIL DISTURBANCE ACTIVITIES WILL BE AVOIDED DURING SIGNIFICANT RAINSTORM.
3. SURFACE COVER THROUGHOUT PROJECT AREA IS PREDOMINANTLY HERBACEOUS. NO TREES WILL BE DISTURBED AS PART OF THE VEGETATION CLEARING ACTIVITIES WITHIN THE SOURCE AREAS, TEMPORARY ACCESS ROUTES LOCATED OUTSIDE OF THE EXISTING PAVED ROADWAYS, AND WORK AREA.
4. TOTAL TEMPORARY DISTURBANCES WITHIN THE PROJECT AREA ARE APPROXIMATELY 50,000 SQ. FT./1.1 ACRE.
5. WETLAND BOUNDARIES WERE DELINEATED IN 2011 AND VERIFIED ON JANUARY 2. 2015 BY ARCADIS STAFF TRAINED IN WETLAND DELINEATION CONSISTENT WITH DEFINITIONS PROVIDED AT 33 CFR 328.3(A)(1–8), THE 1987/89 WETLAND MANUALS, AND THE 2012 REGIONAL SUPPLEMENT.
6. COORDINATE SYSTEM IS NEW JERSEY STATE PLAN NAD 83 (FEET).
7. WETLANDS DELINEATED WITHIN THE PROJECT AREA MEET THE DEFINITION OF EXCEPTIONAL RESOURCE VALUE WETLANDS, REQUIRING A 150–FOOT TRANSITION AREA.
8. JURISDICTIONAL BOUNDARIES SHALL BE CONSIDERED DRAFT UNTIL REVIEW AND APPROVAL BY NJDEP.

SOIL EROSION AND SEDIMENT CONTROL PLAN CERTIFICATION

In accordance with the "Soil Erosion and Sediment Control Act", Chapter 251, Public Laws of 1975, the Morris County Soil Conservation District hereby certifies the subject plan does conform to the standards for Soil Erosion and Sediment Control in New Jersey promulgated pursuant to the Act.

Name of Project: Kenvil Works Facility

Street and Municipality: Roxbury Township

Block: 6701 Lot(s): 1 Application No: 2015-9660

NOTE: FAILURE TO COMPLY WITH ANY OF THE PROVISIONS OUTLINED BELOW WILL RESULT IN A DISTRICT ENFORCEMENT ACTION AND ADDITIONAL FEES FOR REPEATED SERVICES

All revision of the subject plan, Engineer's Project No. NJ007000.NJ70.00001 , Original Plan Date: May 1, 2015, Last Plan Revision Date: June 5, 2015 , after certification will void this approval and must be forwarded to this office.

Any conveyance of the project (or portion thereof) will transfer full responsibility for compliance to subsequent owner(s). This District must be notified in writing of any change of ownership.

A written notification indicating the start of land disturbance must be submitted to this District 72 hours in advance.

Prior to the issuance of a "Certificate of Occupancy" by the municipality, the "Soil Erosion and Sediment Control Act", N.J.S.A. 4:24-49 requires this District issue a "Report of Compliance" with the provisions of the certified plan for permanent measures to control soil erosion and sedimentation.

This certification is limited to the controls in this plan. It is not authorization to engage in the proposed land use unless such use has been previously approved by the municipality or other controlling agency.

In-Situ Waste Characterization Memo

In-Situ Waste Characterization Memo
Bioremediation Pilot Study
Hercules Kenvil Works Facility
Kenvil, New Jersey

PROJECT BACKGROUND

On behalf of Hercules Incorporated (Hercules), a wholly owned subsidiary of Ashland Inc., ARCADIS U.S., Inc. (ARCADIS) has prepared this memorandum to provide background on in-situ waste characterization and determination activities conducted in support of a bioremediation pilot study (pilot study) associated with a former 2,4,6-trinitrotoluene (TNT)/ dynamite manufacturing area (Project area) of the Kenvil Works Facility (Facility). The Facility occupies 1,059 acres along Howard Boulevard, in Kenvil, Morris County, New Jersey. Pilot study activities will occupy a small area in the southwest corner of the Facility.

Approximately 800 acres of the Facility supported former manufacturing operations. The remaining 400 acres are undeveloped areas between process units and around the perimeter of the Facility; these undeveloped areas acted as buffers between the former active portions of the Facility and the surrounding community. The Project area represents one of the earliest developed portions of the Facility, with manufacturing operations beginning operation in 1871 and ceasing in 1996.

Hercules conducted numerous site investigation and remedial investigation activities from 2003 through 2014 in the Project area. Based on the investigation findings, site-related constituents, including TNT, attributed to historical manufacturing operations were detected in soil and groundwater. TNT source material was distributed throughout the top few feet of soil throughout much of the Project area. Other relevant site-related constituents detected in the Project area included 2,4-dinitrotoluene and 2,6-dinitrotoluene (DNT, a degradation product of TNT) and lead. In 2013, Hercules increased focus on the development of a remedial action strategy and evaluated the bioremediation of TNT during a bench-scale TNT soil separation treatability study. Based on the findings of the treatability study, bioremediation was presented as a viable option for remediation of TNT in soil. Bioremediation will be further evaluated on a pilot scale to be conducted during the summer/fall of 2015. The pilot scale design will consider scalability, such that study conditions (e.g., pile size, surface area-to-volume ratio) mimic or represent those that can be used for planning for future full-scale implementation.

In accordance with Section 1.2 of SW-846 Method 1311 (Toxicity Characteristic Leachate Procedure [TCLP]), analytical data generated from historical site investigation and remedial investigation activities were screened using the "Rule of 20" to identify constituents detected in study area soil samples with concentrations unlikely to exceed a regulatory level (Maximum Concentrations of Contaminants for the Toxicity Characteristic, as presented in 40 CFR 261.24). TNT and 2,6-dinitrotoluene have no associated regulatory levels and were excluded from the evaluation. Screening identified 2,4-dinitrotoluene and lead in study area soil samples at concentrations requiring TCLP analysis to support waste characterization. As such, TCLP analysis for SVOCs (including 2,4-dinitrotoluene) and metals (including lead) was conducted.

As described in ARCADIS's In-Situ Waste Characterization Plan dated May 29, 2014 (Appendix A), waste characterization sampling activities were conducted to achieve the following objectives:

- Confirm the homogeneity of the soil structure in target sampling areas within the TNT/Dynamite Area as identified in the historical site investigation and remedial investigation dataset;
- Characterize up to 2,400 cubic yards of material in target sampling areas (sampling area footprint to a depth of 3 feet below ground surface);
- Identify target sampling area soils that would meet the definition of non-hazardous waste upon excavation; and
- Identify target sampling area soils that would meet the definition of hazardous waste upon excavation, and associated permitting requirements for pilot study activities.

The remainder of this document summarizes the sampling process and results to characterize soil in support of the bioremediation pilot study.

CHARACTERIZATION PROCESS

The in-situ waste characterization process summarized herein has been coordinated through a licensed site remediation professional (LSRP) and conducted in accordance with the New Jersey Department of Environmental Protection (NJDEP's) Technical Requirements for Site Remediation (TRSR), New Jersey Administrative Code (N.J.A.C.) 7:26E, ARCADIS's In-Situ Waste Characterization Plan dated May 29, 2014, and ARCADIS's Response to NJDEP Comments on the In-Situ Waste Characterization Plan dated March 19, 2015. The characterization process meets the requirements regarding waste characterization soil sampling established in Appendix 1 of NJDEP's Waste Classification Request Form (HWM-009) and NJDEP's Field Sampling Procedures Manual (NJDEP 2005).

In order to characterize the Project area, three sampling locations were chosen. These areas were given the designations "A", "B", and "C". These areas are located at the base of the ridgeline that borders the site to the west in a disturbed area where former TNT production occurred (Figure 1). These areas were divided into either two (Area B) or three (Area A and Area C) approximately 2,700 square ft. (sq. ft.) subareas (52 ft. by 52 ft.) (Figures 2 through 4). These areas were the source of soil used in the 2013 bench-scale TNT soil separation treatability study, and represent some of the highest historical concentrations of TNT detected on-site and were targeted in the in-situ waste characterization process as a conservative approach.

Samples were composited from discrete samples collected at random depths for TCLP analysis to support characterization of soil prior to excavation, and identify regulatory permitting to facilitate compliant implementation of the pilot study.

SAMPLING PROCEDURE

The sampling design to characterize the Project area utilized a real-time TNT screen for distinct depths while onsite in order to determine the number of samples to collect. A 10-ft. by 10 ft. grid was established over each subarea, with each grid square representing a possible sample location. Each grid square was given a number. Microsoft Excel was used as a random number generator in order to determine which of

these sample locations was sampled. The first sample location based on the random number generator was excavated to three feet below ground surface with a backhoe. The one, two and three-ft. intervals were screened with an EXPRAY test kit to determine the presence of TNT.

The sampling approach was to increase the number of composite samples relative to how deep TNT was detected with the EXPRAY kit. This approach ensured that the number of samples collected was proportional to the volume of soil being characterized, such that sampling occurred at a frequency of one discrete sample to every 20 cubic yards of material requiring characterization. If TNT was detected with the EXPRAY kit in the:

- 1 ft. interval, five discrete samples were composited into one sample for laboratory analysis for the entire 52 ft. by 52 ft. subarea
- 2 ft. interval, the 52 ft. by 52 ft. subarea was subdivided in half (1,350 sq. ft. each). Five discrete samples were composited into one sample for laboratory analysis for both subsections. Resulting in a total of two composite samples for that subarea.
- 3 ft. interval, the 52 ft. by 52 ft. subarea was subdivided into three sections (900 sq. ft. each) and 5 discrete samples were composited into one sample for laboratory analysis for each of the three subsections resulting in a total of three composite samples for that subarea.

The depth at which each discrete sample was collected was determined by another random number generator that produced a depth in inches.

In total 25 discrete samples were composited into five samples for laboratory analysis in Area A. Fifteen discrete samples were composited into three samples for laboratory analysis in Area B. Twenty-five discrete samples were composited into five samples for laboratory analysis in Area C. The sample locations are shown on Figures 2 through 4. The discrete sample IDs, results of field TNT screen and sample depth of each discrete sample is presented on Table 1. Lab samples were submitted to Lancaster Labs for analysis via USEPA Method 1311, RCRA Characteristics, USEPA Method 8330, USEPA Method 8270, and USEPA Method SW-846 6010B. Once sampling was complete, soil sample excavations were backfilled with the remaining excavated material.. The analytical results are summarized on Table 2.

WASTE DETERMINATION

Based on the information presented below, the U.S. Environmental Protection Agency's (USEPA's) Six-Step Hazardous Waste Identification Flow Chart (per 40 CFR 261) was conducted to complete the waste determination for the Project area (https://www.fedcenter.gov/assistance/facilitytour/hazardous/whatis/flowchart/index.cfm), as follows:

Step 1 – Is Your Material a Solid Waste?	Yes – Material is soil.
Step 2 – Is Your Solid Waste Excluded from Hazardous Waste Regulations?	No – Solid waste in the Project area does not meet any of the potentially applicable exclusion criteria.
Step 3 – Is Your Solid Waste a Listed Waste?	No – Although TNT, DNT, and lead are present in soil in the Project area, the soil in the Project area is not considered a listed waste as the materials are not present in the form of a "commercial chemical product". Based on process knowledge, the former Hercules Kenvil Works Facility has one F-, K- or P-listed waste area which is known as the Red Water Lagoon. Commercial chemical products generated during the manufacturer of TNT are known to have been stockpiled in the Red Water Lagoon.
Step 4 – Is your Waste a Characteristic Waste?	Yes – Concentrations of lead in one of the 13 TCLP samples exceed the criteria when compared to Table 1 of CFR261.24. All other samples were below standards. Soil in the Project area does not exhibit any of the following criteria: • Ignitability – material is a non-liquid that is not capable of causing a fire at current concentrations • Corrosivity – pH of the waste is not less than 2 or greater than 12.5 • Reactivity – waste does not meet any of the these criteria
Step 5 – Is Your Solid Waste Subject to the Mixture Rule?	No – there are no listed hazardous wastes known or expected to be present in the waste (See Step 3).
Step 6 – Is Your Solid Waste Subject to the Derived From Rule?	No – the waste is not derived from the treatment storage or disposal of a hazardous waste.

Based on the investigation conducted at the Project area (as described above) and the analysis per USEPA's Six-Step Hazardous Waste Identification Flow Chart, soil in the majority of the Project area has been determined to be a non-hazardous waste based on the representative characterization sampling and lack of sample results exceeding criteria. The one exception to this is the sample collected from B1-2 which exceeded the CFR261.24 standard for lead. This area will not be included in the pilot study.

Notes:

1. Waste Classification Hazardous Level from Waste Classification HWM-009 (6/22/09) - Appendix 3

Shaded Indicates value is above the Waste Classification Hazardous Level
J Indicates an estimated value.
-- No published criteria available.
ND The compound was analyzed for but not detected.
NA The compound was not analyzed.
mg/L milligrams per liter
mg/kg milligrams per kilogram
ug/kg micrograms per kilogram
Non-Ignitable The sample did not spontaneously ignite when exposed to air or water; the sample did not ignite by friction; the sample vapors did not ignite when exposed to a flame using a closed cup
[ ] Brackets indicate a duplicate sample.

Notes:

1. Waste Classification Hazardous Level from Waste Classification HWM-009 (6/22/09) - Appendix 3

Shaded Indicates value is above the Waste Classification Hazardous
J Indicates an estimated value.
-- No published criteria available.
ND The compound was analyzed for but not detected.
NA The compound was not analyzed.
mg/L milligrams per liter
mg/kg milligrams per kilogram
ug/kg micrograms per kilogram
Non-Ignitable The sample did not spontaneously ignite when exposed to a by friction; the sample vapors did not ignite when exposed to
[ ] Brackets indicate a duplicate sample.

Dear Mr. Confer:

On behalf of Hercules Incorporated (Hercules), ARCADIS prepared this *In-situ Waste Characterization Plan* (work plan) in support of a bioremediation pilot study at the Former Hercules Kenvil Works Facility in Kenvil, Morris County, New Jersey (the site). This work plan presents a brief background of the site and the scope of the bioremediation pilot study, and outlines a waste characterization sampling approach consistent with applicable New Jersey Department of Environmental Protection (NJDEP) guidance.

The remedial program at the site is coordinated through a licensed site remediation professional (LSRP) and conducted in accordance with NJDEP's Technical Requirements for Site Remediation (TRSR), New Jersey Administrative Code (N.J.A.C.) 7:26E. This work plan meets the requirements regarding waste characterization soil sampling established in Appendix 1 of NJDEP's Waste Classification Request Form (HWM-009) and NJDEP's Field Sampling Procedures Manual (NJDEP 2005).

The site occupies approximately 1,200 acres along Howard Boulevard, about 0.5 miles northwest of the center of Kenvil, in Morris County, New Jersey. The site began operation in 1871 and initially manufactured dynamite to support iron ore mining operations in the surrounding area. Through the early and middle parts of the 20th century, Hercules expanded its manufacturing operations to meet the growing economic need for explosives and propellants. In the final years of operation,

smokeless powder was the primary product, and was produced by Alliant under a site lease agreement from 1995 to 1996. The facility ceased operation in 1996. Hercules, a wholly-owned subsidiary of Ashland, Inc. and the current property owner, remains responsible for the remediation and closure of the site.

Hercules conducted a site investigation/remedial investigation (SI/RI) spanning 2003 through 2006, with supplemental sampling conducted in 2009 (groundwater only) and 2014 (soil and groundwater). As part of the RI, Hercules prioritizing areas of the site requiring some form of active remediation based on constituent types/concentrations, complexity, and schedule/duration of the presumptive remedy. In 2009, Hercules initiated focused investigation of the degradation of 2,4,6-trinitrotoluene (TNT) in soil and groundwater in the TNT/Dynamite Area to develop a remedial action strategy. Initial study results indicated that source removal and monitored natural attenuation represented a plausible remedy. TNT source material is distributed throughout the top few feet of soil throughout much of the TNT/Dynamite Area. Other relevant constituents of concern (COCs) in this area include 2,4- and 2,6-dinitrotoluene (DNT, a degradate of TNT) and lead.

In 2013, a bench-scale TNT soil separation treatability study evaluated the effectiveness of separating solid phase TNT from site soil. Approximately 240 pounds of soil were collected from representative areas of the TNT/Dynamite Area to support the treatability work. Treatability study results indicated that separation, and segregation, were effective; and certain of the resulting material streams required additional treatment to meet NJDEP's Non-Residential Direct Contact Soil Remediation Standards (NRDCSRS) and requirements for beneficial reuse onsite (NJDEP 2011). The technical report summarizing the results of the TNT soil separation treatability study identified options for the additional treatment needed to reduce concentrations of TNT and its breakdown products to at or below NRDCSRS.

Bioremediation was presented as a viable option requiring further study in the treatability study report. In response, Hercules developed a pilot study to evaluate bioremediation of the material streams requiring further treatment as identified in the treatability study. Pilot study design requires consideration of scalability, such that study conditions (e.g., pile size, surface area-to-volume ratio) mimic or represent those that would be used during full-scale treatment. As a result, the pilot study requires the excavation, processing and sampling of approximately 350 cubic yards of material from within the TNT/Dynamite Area.

During bioremediation pilot study work plan preparation, the project team reviewed existing information and institutional knowledge in support of a waste determination and regulatory compliance. Preliminary screening of constituent concentrations in soil using the 20X rule identified the potential for toxicity characteristics for lead and 2,4-dinitrotoluene to drive waste classification. Waste characterization sampling will refine the results of the preliminary screen and facilitate completing the waste determination for materials that will support the pilot study. This information will also support regulatory compliance planning for full-scale implementation.

The objectives of the sampling program are as follows:

- Confirm the homogeneity of the soil structure in target sampling areas within the TNT/Dynamite Area as identified in the SI/RI dataset

- Characterize up to 2,400 cubic yards of material in target sampling areas (sampling area footprint to a depth of 3 feet below ground surface)

- Identify target sampling area soils that meet would meet the definition of non-hazardous waste upon excavation

- Identify target sampling area soils that would meet the definition of hazardous waste upon excavation, and associated permitting requirements for pilot study activities

The remainder of this document outlines a sampling program to characterize soil in support of the bioremediation pilot study.

SAMPLING PLAN

Proposed soil excavation to support the pilot study focuses on three areas identified and sampled during the TNT treatability study. The three areas (Area A, Area B, and Area C) occur at the base of the ridgeline that borders the site to the west in a disturbed area where former TNT production operations occurred (demolished between 1997 and 2003). Soil in these areas are generally similar, consisting of glacial till comingled with debris. SI/RI data and field test kits used during soil sampling for treatability testing in the three sampling areas indicates that the depth of TNT in soil ranges from 1 foot to 3 feet below ground surface (ft bgs).

Each of the three sampling areas will be subdivided into subareas approximately 2,700 square feet (sq ft) in size, resulting in 8 subareas (three each in Areas A and C, and two in Area B). A 10-foot by 10-foot grid will be established over the sampling area and 5 grid cells within each subarea will be selected at random using a GIS-based random number generator.

A shovel pit will be excavated in each of the selected grid cells. Depth of excavation will be based on the presence of TNT evaluated qualitatively in the field via the EXPRAY test kit ("presence" defined as a strong signature response on the test strip)[1]. Sampling and additional subdivision will occur based on the depth of positive TNT test kit results as follows:

TNT occurs only in the 0 to 1 ft bgs interval: the subarea will remain at 2,700 sq ft and a sample will be collected from each of the 5 selected grid cells to create a 5-part composite sample representative of the 100 cubic yards of soil (2,700 square feet to a depth of 1 ft bgs equals 2,700 cubic feet [100 cubic yards])

TNT occurs in the 0 to 2 ft bgs interval: the subarea will be further divided into two equal areas (1,350 sq ft each) and five random grid cells will be selected in each area (i.e., additional random grid cells to bring the total number in each subarea to five). The shovel pit and TNT test kit process will be repeated to identify the vertical extent of TNT in each grid cell. Assuming that TNT is only present to a depth of 2 ft bgs, a sample will be collected from each of the 5 selected grid cells to create a 5-part composite sample representative of 100 cubic yards of soil (1,350 sq ft to a depth of 2 ft bgs equals 2,700 cubic feet [100 cubic yards]). If TNT is present at dpeths greater than 2 ft bgs, the sampling scheme outlined below will be used.

TNT occurs throughout the 0 to 3 foot bgs interval: the subarea will be further divided into three equal areas (900 sq ft each) and five random grid cells will be selected in each area (i.e., additional random grid cells to bring the total number in each subarea to five). A sample will be collected from each of the 5 selected grid cells to create a

[1] TNT presence/relative concentrations are used to identify the extents of excavation and waste characterization soil sampling areas/subareas because TNT is the focus of the bioremediation pilot study and primary COC in the area of study. Co-located DNT and lead will be evaluated concurrently, but are not the primary focus of the pilot study. The final remedy will address TNT, DNT and lead (and other constituents, as needed) to achieve remedial action objectives.

5-part composite sample representative of 100 cubic yards of soil (900 sq ft to a depth of 3 ft bgs equals 2,700 cubic feet [100 cubic yards]).

The depth of discrete samples collected from each grid cell will be selected randomly using a random number generator. A number ranging from zero to the total depth in inches will be selected to represent the depth interval from which the sample will be collected. For example, the random number 14 represents a depth of 14 inches.

Based on this approach, a minimum of 8 and a maximum of 24 waste characterization samples will be collected to evaluate approximately 800 and 2,400 cubic yards of soil, respectively. Each 5-part composite will represent 100 cubic yards of soil, taking into account spatial variability in both the horizontal and vertical planes.

Samples will be submitted to Lancaster Laboratories for the following Resource Conservation and Recovery Act (RCRA) characteristic analyses:

- Ignitability
- Corrosivity
- Reactivity
- Toxicity (Method 1311 - Toxicity Characteristic Leaching Procedure [TCLP] for RCRA 8 Metals and RCRA Semivolatiles)

In addition to the waste characterization analyses listed above, co-located samples will be analyzed for TNT and DNT by SW-846 8330, and lead by SW-846 6010B to better understand the correlation between total concentrations in soil and leachable concentrations generated by the TCLP analysis.

Upon receipt of the analytical data, Hercules will tabulate the results and develop a Waste Determination.

SCHEDULE

The bioremediation pilot study is designed to take advantage of the natural heat of summer to facilitate the biological degradation process. Soil piles need to be in the

field no later than July 28. Approximately 5 weeks are required to excavate and separate the soil into the fractions needed to support the study. As such, Hercules respectfully requests approval of this work plan no later than June 16, 2014 to allow field sampling and analysis, and site mobilization to occur before the week of June 23, 2014.

Hercules appreciates your review of this work plan. Please contact Scott Larew of ARCADIS at 609.366.9087 or scott.larew@arcadis-us.com with questions.

Sincerely,

ARCADIS U.S., Inc.

Scott M. Larew
Project Manager

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
Wet Chemistry	**SW-846 Chapter 7**					
00496	Corrosivity	n.a.	See Below			1
	The pH of the sample is 5.11 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.					
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity	n.a.	See Below			1
	Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".					

General Sample Comments

State of New Jersey Lab Certification No. PA011

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

CAT No.	Analysis Name	CAS Number	Dry Result	Dry Method Detection Limit*	Dry Limit of Quantitation	Dilution Factor
Wet Chemistry	**SW-846 Chapter 7**					
00496	Corrosivity	n.a.	See Below			1
	The pH of the sample is 4.70 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.					
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity	n.a.	See Below			1
	Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".					
Wet Chemistry	**SM 2540 G-1997**		%	%	%	
00111	Moisture	n.a.	13.2	0.50	0.50	1
	Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.					

General Sample Comments

Wet Chemistry	**SW-846 9045C modified**		**Std. Units**	**Std. Units**	**Std. Units**	
	The pH was measured in water at 19.1 C.					
Wet Chemistry	**SW-846 Chapter 7**					
00496	Corrosivity	n.a.	See Below			1
	The pH of the sample is 4.93 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.					
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity	n.a.	See Below			1
	Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
Wet Chemistry	**SW-846 Chapter 7**					
00496	Corrosivity	n.a.	See Below			1
	The pH of the sample is 4.65 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.					
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity	n.a.	See Below			1
	Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".

General Sample Comments

State of New Jersey Lab Certification No. PA011

If the analysis is for determination of Hazardous Waste Characteristics, see Table 1 in EPA Code of Federal Regulations 40 CFR 261.24.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
Wet Chemistry	**SW-846 9045C modified**		**Std. Units**	**Std. Units**	**Std. Units**	
00394	pH The pH was measured in water at 16.9 C.	n.a.	5.90	0.0100	0.0100	1
	SW-846 Chapter 7					
00496	Corrosivity The pH of the sample is 5.90 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.	n.a.	See Below			1
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".	n.a.	See Below			1

B1ASR SDG#: KVM37-18

CAT No.	Analysis Name	CAS Number	Dry Result	Dry Method Detection Limit*	Dry Limit of Quantitation	Dilution Factor
Wet Chemistry	**SW-846 Chapter 7**					
00496	Corrosivity	n.a.	See Below			1
	The pH of the sample is 5.90 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.					
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity	n.a.	See Below			1
	Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".					
Wet Chemistry	**SM 2540 G-1997**		**%**	**%**	**%**	
00111	Moisture	n.a.	10.3	0.50	0.50	1
	Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.

General Sample Comments

State of New Jersey Lab Certification No. PA011

If the analysis is for determination of Hazardous Waste Characteristics, see Table 1 in EPA Code of Federal Regulations 40 CFR 261.24.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Quality Control Summary

Client Name: Ashland Chemical Group Number: 1554339
Reported: 04/29/2015 10:42

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

B - Analyte detected in the blank
C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and the < Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, ISO17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

AB12A SDG#: KVM38-01

CAT No.	Analysis Name	CAS Number	Dry Result	Dry Method Detection Limit*	Dry Limit of Quantitation	Dilution Factor
Wet Chemistry	**SW-846 Chapter 7**					
00496	Corrosivity	n.a.	See Below			1
	The pH of the sample is 7.20 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.					
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity	n.a.	See Below			1
	Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".					
Wet Chemistry	**SM 2540 G-1997**		%	%	%	
00111	Moisture	n.a.	18.7	0.50	0.50	1
	Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.					

General Sample Comments

State of New Jersey Lab Certification No. PA011

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

AB21A SDG#: KVM38-04

CAT No.	Analysis Name	CAS Number	Dry Result	Dry Method Detection Limit*	Dry Limit of Quantitation	Dilution Factor
Wet Chemistry	**SW-846 Chapter 7**					
00496	Corrosivity	n.a.	See Below			1
	The pH of the sample is 5.14 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.					
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity	n.a.	See Below			1
	Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".					
Wet Chemistry	**SM 2540 G-1997**		%	%	%	
00111	Moisture	n.a.	18.3	0.50	0.50	1
	Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.

CAT No.	Analysis Name	CAS Number	Dry Result	Dry Method Detection Limit*	Dry Limit of Quantitation	Dilution Factor
Wet Chemistry	**SW-846 Chapter 7**					
00496	Corrosivity	n.a.	See Below			1
	The pH of the sample is 5.39 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.					
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity	n.a.	See Below			1
	Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".					
Wet Chemistry	**SM 2540 G-1997**		%	%	%	
00111	Moisture	n.a.	15.2	0.50	0.50	1
	Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.					

General Sample Comments

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
Wet Chemistry	**SW-846 Chapter 7**					
00496	Corrosivity	n.a.	See Below			1
	The pH of the sample is 5.01 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.					
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity	n.a.	See Below			1
	Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
Wet Chemistry	**SW-846 9045C modified**		**Std. Units**	**Std. Units**	**Std. Units**	
	The pH was measured in water at 16.6 C.					
Wet Chemistry	**SW-846 Chapter 7**					
00496	Corrosivity	n.a.	See Below			1
	The pH of the sample is 4.56 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.					
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity	n.a.	See Below			1
	Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".

Wet Chemistry	**SW-846 Chapter 7**					
00496	Corrosivity	n.a.	See Below			1
	The pH of the sample is 4.54 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.					
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity	n.a.	See Below			1
	Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
Wet Chemistry	**SW-846 Chapter 7**					
00496	Corrosivity	n.a.	See Below			1
	The pH of the sample is 4.81 indicating that the sample is not corrosive. A sample is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5.					
	SW-846 Chapter 7.3		**see below**	**see below**	**see below**	
01121	Reactivity	n.a.	See Below			1
	Reactivity: This sample was extracted and analyzed by the interim method described in SW-846 Revision 3, December 1996 - Chapter 7.3. The Interim Guidance for Reactive Cyanide and Reactive Sulfide (SW-846 Sections 7.3.3 and 7.3.4 of Chapter 7 - December 1996) identifies a reactive material as generating more than 250 mg/kg of hydrogen cyanide or 500 mg/kg of hydrogen sulfide. This waste is not considered hazardous due to reactivity based on that standard. These results do not reflect total cyanide or total sulfide. On July 14, 2005, EPA published a rule in the Federal Register that removed the Interim Guidance and the method referenced above. At this time there is no specific guidance or a method to be used to evaluate "Reactivity".

General Sample Comments

State of New Jersey Lab Certification No. PA011

If the analysis is for determination of Hazardous Waste Characteristics, see Table 1 in EPA Code of Federal Regulations 40 CFR 261.24.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Quality Control Summary

Client Name: Ashland Chemical Group Number: 1555096
Reported: 05/04/2015 11:52

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

B - Analyte detected in the blank
C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and the < Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, ISO17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

10727	N-Nitroso-di-n-propylamine	621-64-7	N.D.	17	33	1
10727	N-Nitrosodiphenylamine	86-30-6	N.D.	17	33	1
	N-nitrosodiphenylamine decomposes in the GC inlet forming diphenylamine. The result reported for N-nitrosodiphenylamine represents the combined total of both compounds.

GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	13 J	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1
10727	4-Nitroaniline	100-01-6	N.D.	66	170	1
10727	Nitrobenzene	98-95-3	N.D.	17	33	1
10727	2-Nitrophenol	88-75-5	N.D.	17	33	1
10727	4-Nitrophenol	100-02-7	N.D.	170	500	1
10727	N-Nitroso-di-n-propylamine	621-64-7	N.D.	17	33	1
10727	N-Nitrosodiphenylamine	86-30-6	N.D.	17	33	1
	N-nitrosodiphenylamine decomposes in the GC inlet forming diphenylamine. The result reported for N-nitrosodiphenylamine represents the combined total of both compounds.					
10727	Di-n-octylphthalate	117-84-0	N.D.	66	170	1
10727	Pentachlorophenol	87-86-5	N.D.	33	170	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	16	33	1
10727	4-Methylphenol	106-44-5	N.D.	16	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	16	33	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	16	33	1
10727	4-Methylphenol	106-44-5	N.D.	16	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	16	33	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1
10727	4-Nitroaniline	100-01-6	N.D.	66	170	1
10727	Nitrobenzene	98-95-3	N.D.	17	33	1
10727	2-Nitrophenol	88-75-5	N.D.	17	33	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1
10727	4-Nitroaniline	100-01-6	N.D.	66	170	1

CAT No.	Analysis Name	CAS Number	As Received Result		As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**		**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.		16	33	1
10727	4-Methylphenol	106-44-5	N.D.		16	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.						
10727	Naphthalene	91-20-3	N.D.		3	17	1
10727	2-Nitroaniline	88-74-4	N.D.		16	33	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1
10727	4-Nitroaniline	100-01-6	N.D.	66	170	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1

10727	N-Nitroso-di-n-propylamine	621-64-7	N.D.	17	33	1
10727	N-Nitrosodiphenylamine	86-30-6	N.D.	17	33	1
	N-nitrosodiphenylamine decomposes in the GC inlet forming diphenylamine. The result reported for N-nitrosodiphenylamine represents the combined total of both compounds.					
10727	Di-n-octylphthalate	117-84-0	N.D.	66	170	1

10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1
10727	4-Nitroaniline	100-01-6	N.D.	66	170	1
10727	Nitrobenzene	98-95-3	N.D.	17	33	1
10727	2-Nitrophenol	88-75-5	N.D.	17	33	1
10727	4-Nitrophenol	100-02-7	N.D.	170	500	1
10727	N-Nitroso-di-n-propylamine	621-64-7	N.D.	17	33	1
10727	N-Nitrosodiphenylamine	86-30-6	N.D.	17	33	1
	N-nitrosodiphenylamine decomposes in the GC inlet forming diphenylamine. The result reported for N-nitrosodiphenylamine represents the combined total of both compounds.					
10727	Di-n-octylphthalate	117-84-0	N.D.	66	170	1
10727	Pentachlorophenol	87-86-5	N.D.	33	170	1
10727	Phenanthrene	85-01-8	26	3	17	1

CAT No.	Analysis Name	CAS Number	As Received Result		As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**		**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.		17	33	1
10727	4-Methylphenol	106-44-5	N.D.		17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.						
10727	Naphthalene	91-20-3	N.D.		3	17	1
10727	2-Nitroaniline	88-74-4	N.D.		17	33	1
10727	3-Nitroaniline	99-09-2	N.D.		67	170	1

CAT No.	Analysis Name	CAS Number	As Received Result		As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**		**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.		17	33	1
10727	4-Methylphenol	106-44-5	N.D.		17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.						
10727	Naphthalene	91-20-3	N.D.		3	17	1
10727	2-Nitroaniline	88-74-4	N.D.		17	33	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1
10727	4-Nitroaniline	100-01-6	N.D.	66	170	1
10727	Nitrobenzene	98-95-3	N.D.	17	33	1
10727	2-Nitrophenol	88-75-5	N.D.	17	33	1

CAT No.	Analysis Name	CAS Number	As Received Result		As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**		**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.		16	33	1
10727	4-Methylphenol	106-44-5	N.D.		16	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.						
10727	Naphthalene	91-20-3	N.D.		3	17	1
10727	2-Nitroaniline	88-74-4	N.D.		16	33	1
10727	3-Nitroaniline	99-09-2	N.D.		66	160	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1
10727	4-Nitroaniline	100-01-6	N.D.	66	170	1
10727	Nitrobenzene	98-95-3	N.D.	17	33	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	67	170	1
10727	4-Nitroaniline	100-01-6	N.D.	67	170	1
10727	Nitrobenzene	98-95-3	N.D.	17	33	1
10727	2-Nitrophenol	88-75-5	N.D.	17	33	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	16	33	1
10727	4-Methylphenol	106-44-5	N.D.	16	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	16	33	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	4 J	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	67	170	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	N.D.	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1

FORM I SV-1

Quality Control Summary

Client Name: Ashland Specialty Ingredients Group Number: 1578511
Reported: 08/13/2015 12:47

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

B - Analyte detected in the blank
C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and the < Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, ISO17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Quality Control Summary

Client Name: Ashland Specialty Ingredients Group Number: 1578519
Reported: 08/12/2015 16:53

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

B - Analyte detected in the blank
C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and the < Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, ISO17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Quality Control Summary

Client Name: Ashland Specialty Ingredients Group Number: 1581571
Reported: 08/27/2015 10:09

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Laboratory Compliance Quality Control

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

B - Analyte detected in the blank
C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and the < Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, ISO17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**		**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.		17	33	1
10727	4-Methylphenol	106-44-5	N.D.		17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.						
10727	Naphthalene	91-20-3	13	J	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.		17	33	1
10727	3-Nitroaniline	99-09-2	N.D.		66	170	1
10727	4-Nitroaniline	100-01-6	N.D.		66	170	1
10727	Nitrobenzene	98-95-3	51		17	33	1
10727	2-Nitrophenol	88-75-5	N.D.		17	33	1
10727	4-Nitrophenol	100-02-7	N.D.		170	500	1
10727	N-Nitroso-di-n-propylamine	621-64-7	N.D.		17	33	1
10727	N-Nitrosodiphenylamine	86-30-6	N.D.		17	33	1
	N-nitrosodiphenylamine decomposes in the GC inlet forming diphenylamine. The result reported for N-nitrosodiphenylamine represents the combined total of both compounds.						
10727	Di-n-octylphthalate	117-84-0	N.D.		66	170	1
10727	Pentachlorophenol	87-86-5	N.D.		33	170	1

CAT No.	Analysis Name	CAS Number	As Received Result		As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**		**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.		17	33	1
10727	4-Methylphenol	106-44-5	N.D.		17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.						
10727	Naphthalene	91-20-3	17		3	17	1
10727	2-Nitroaniline	88-74-4	N.D.		17	33	1

10727	2-Methylphenol	95-48-7	N.D.		17	33	1
10727	4-Methylphenol	106-44-5	N.D.		17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.						
10727	Naphthalene	91-20-3	10	J	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.		17	33	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	6 J	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	170	1
10727	4-Nitroaniline	100-01-6	N.D.	66	170	1

CAT No.	Analysis Name	CAS Number	As Received Result		As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**		**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.		17	33	1
10727	4-Methylphenol	106-44-5	28	J	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.						
10727	Naphthalene	91-20-3	11	J	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.		17	33	1
10727	3-Nitroaniline	99-09-2	110	J	66	170	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	9 J	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1
10727	3-Nitroaniline	99-09-2	N.D.	66	160	1
10727	4-Nitroaniline	100-01-6	N.D.	66	160	1
10727	Nitrobenzene	98-95-3	N.D.	17	33	1
10727	2-Nitrophenol	88-75-5	N.D.	17	33	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	10 J	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1

CAT No.	Analysis Name	CAS Number	As Received Result	As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**	**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.	17	33	1
10727	4-Methylphenol	106-44-5	N.D.	17	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.					
10727	Naphthalene	91-20-3	14 J	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.	17	33	1

CAT No.	Analysis Name	CAS Number	As Received Result		As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Semivolatiles	**SW-846 8270C**		**ug/kg**		**ug/kg**	**ug/kg**	
10727	2-Methylphenol	95-48-7	N.D.		16	33	1
10727	4-Methylphenol	106-44-5	N.D.		16	33	1
	3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.						
10727	Naphthalene	91-20-3	16	J	3	17	1
10727	2-Nitroaniline	88-74-4	N.D.		16	33	1
10727	3-Nitroaniline	99-09-2	N.D.		66	160	1

FORM I SV-1

Quality Control Summary

Client Name: Ashland Specialty Ingredients Group Number: 1581570
Reported: 08/13/2015 15:05

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

B - Analyte detected in the blank
C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and the < Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, ISO17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

FORM I SV-1

Quality Control Summary

Client Name: Hercules Incorporated Group Number: 1585374
Reported: 08/26/2015 13:53

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

B - Analyte detected in the blank
C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and the < Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, ISO17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.
