Notes and Definitions

X	Precision for the matrix spike duplicate, laboratory control sample duplicate or lab duplicate was outside of control limits.
S	Surrogate recovery was outside of laboratory control limits due to an apparent matrix effect.
P	The difference in the concentrations between the primary and confirmation column was > 40%.
M1	Spike recoveries were not evaluated because of elevated levels of the spiked analyte in the parent sample.
M	The matrix spike and/or matrix spike duplicate recovery was outside of the laboratory control limits.
LC	Resuts may be biased low because of low continuing calibration verification (CCV).
HC	Results may be biased high because of high continuing calibration verification (CCV).
DO	Diluted out.
D	Data reported from a dilution
B	Analyte is also detected in the associated method blank.
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis. If the word 'dry' does not appear after the units, results are reported on an as-is basis.
RPD	Relative Percent Difference

RE: Ashland Kenvil - Kenvil, NJ

Enclosed are the revised analytical results for the samples received by the laboratory on 04/19/2019.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. These results are in compliance with the 2009 NELAC Standards and the appropriate agencies listed below, unless otherwise noted in the case narrative. This analytical report should be reproduced in its entirety.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jessica Esser
Project Manager

Princeton NJ, 08540	Project Manager: Lora Sterner

CASE NARRATIVE

Sample Receipt Information:
56 samples were received on 04/19/2019. Samples were received at 3.1 degrees Celsius. Samples were received in acceptable condition.

Please see the chain of custody (COC) document at the end of this report for additional information.

8095 analysis for samples A191619-41 through A191619-44 was added on 04/29/2019, per the client.

Laboratory Control Samples (LCS):
The E1 footnote on samples A191619-38 and A191619-39 indicates that there were quality control sample exceedances for HMX. The LCS recovery was below acceptable limits. Please see the quality control section of the report for more information.

Continuing Calibration Verification (CCV):
The LC footnote on samples A191619-08 through A191619-11, A191619-20 and A191619-35 through A191619-37 states that there was a low CCV recovery for nitroglycerin. The lower control limit is 80% and the lowest recovery was 65.0%.

The LC footnote on samples A191619-01 through A191619-37 and A191619-41 through A191619-44 states that there was a low CCV recovery for PETN. The lower control limit is 80% and the lowest recovery was 61.8%.

The LC footnote on samples A191619-21 and A191619-37 states that there was a low CCV recovery for HMX. The lower control limit is 80% and the lowest recovery was 72.7%.

The HC footnote on sample A191619-29 states that there was a high CCV recovery for nitrobenzene. The upper control limit is 120% and the highest recovery was 136%.

The HC footnote on sample A191619-06 states that there was a high CCV recovery for 1,3,5-trinitrobenzene. The upper control limit is 120% and the highest recovery was 124%.

The HC footnote on samples A191619-01 through A191619-06, A191619-08 through A191619-13 and A191619-19 states that there was a high CCV recovery for 4-amino-2,6-dinitrotoluene. The upper control limit is 120% and the highest recovery was 296%.

The HC footnote on samples A191619-04 through A191619-06 states that there was a high CCV recovery for 3,5-dinitroaniline. The upper control limit is 120% and the highest recovery was 122%.

The HC footnote on samples A191619-01, A191619-02, A191619-04 through A191619-06 and A191619-08 through A191619-13 states that there was a high CCV recovery for 2-amino-4,6-dinitrotoluene. The upper control limit is 120% and the highest recovery was 138%.

The HC footnote on sample A191619-03 states that there was a high CCV recovery for HMX. The upper control limit is 120% and the highest recovery was 128%.

REASON FOR REVISED REPORT

On 05/04/2019, this report was revised to add additional compounds to the water samples - A191619-38 and A191619-39.

On 06/18/2019, this report was revised to change the sample descriptions for A191619-14 through A191619-18 per client request.

This report should replace "A191619 FINAL 05 03 2019 1622" and "A191619 FINAL 05 04 2019 1043".

Revised Report

Kennedy Jenks Consultants	Project: Ashland Kenvil - Kenvil, NJ
214 Carnegie Center, Suite 103	Project Number: 1540001*61
Princeton NJ, 08540	Project Manager: Lora Sterner

Notes and Definitions

X	Precision for the matrix spike duplicate, laboratory control sample duplicate or lab duplicate was outside of control limits.
U	Analyte included in the analysis, but not detected
S	Surrogate recovery was outside of laboratory control limits due to an apparent matrix effect.
P	The difference in the concentrations between the primary and confirmation column was > 40%.
M	The matrix spike and/or matrix spike duplicate recovery was outside of the laboratory control limits.
LC	Results may be biased low because of low continuing calibration verification (CCV).
HC	Results may be biased high because of high continuing calibration verification (CCV).
E1	Estimated value because of quality control sample exceedances.
D	Data reported from a dilution
ND	Analyte NOT DETECTED at or above the reporting limit or limit of detection (if listed).
NR	Not Reported
dry	Sample results reported on a dry weight basis. If the word 'dry' does not appear after the units, results are reported on an as-is basis.
RPD	Relative Percent Difference

RE: Ashland Kenvil - Kenvil, NJ

Enclosed are the revised analytical results for the samples received by the laboratory on the dates listed on the following page(s).

The results in this report apply to the samples analyzed in accordance with the chain of custody document. These results are in compliance with the 2009 NELAC Standards and the appropriate agencies listed below, unless otherwise noted in the case narrative. This analytical report should be reproduced in its entirety.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jessica Esser
Project Manager

Revised Report

Kennedy Jenks Consultants	Project: Ashland Kenvil - Kenvil, NJ
214 Carnegie Center, Suite 103	Project Number: 1540001*61
Princeton NJ, 08540	Project Manager: Lora Sterner

ANALYTICAL REPORT FOR SAMPLES

Sample ID	Laboratory ID	Matrix	Date Sampled	Date Received
TP-RD-B11-28(09.0-09.5)	A191619-50	Soil	04/16/2019	04/19/2019
D14-667-03(05.0-05.5)	A191901-01	Soil	04/16/2019	04/19/2019

CASE NARRATIVE

Sample Receipt Information:
Samples released from hold by client via email.

Sample A191901-01 was held frozen by Pace-Madison.

Please see the chain of custody (COC) documents at the end of this report for additional information.

Laboratory Control Samples (LCS):
The E1 footnote on sample A191901-01 indicates that there were quality control sample exceedances for 1,3-dinitrobenzene. The LCS recovery was below acceptable limits. Please see the quality control section of the report for more information.

Continuing Calibration Verification (CCV):
The LC footnote on sample A191901-01 states that there was a low CCV recovery for PETN. The lower control limit is 80% and the lowest recovery was 71.7%.

CCV indicates a potential high bias for nitrobenzene, 2-nitrotoluene, 3-nitrotoluene and tetryl for sample A191901-01. Sample was less than the reporting limit for these analytes so no further action is required.

REASON FOR REVISED REPORT

This report was revised to change the sample description for A191619-50 per client request. This report should replace "A191619,A191901 FINAL 05 14 2019 0817".

Notes and Definitions

X	Precision for the matrix spike duplicate, laboratory control sample duplicate or lab duplicate was outside of control limits.
U	Analyte included in the analysis, but not detected
S	Surrogate recovery was outside of laboratory control limits due to an apparent matrix effect.
M	The matrix spike and/or matrix spike duplicate recovery was outside of the laboratory control limits.
LC	Results may be biased low because of low continuing calibration verification (CCV).
H	The sample was held beyond the accepted holding time.
E1	Estimated value because of quality control sample exceedances.
D	Data reported from a dilution
ND	Analyte NOT DETECTED at or above the reporting limit or limit of detection (if listed).
NR	Not Reported
dry	Sample results reported on a dry weight basis. If the word 'dry' does not appear after the units, results are reported on an as-is basis.
RPD	Relative Percent Difference

RE: Ashland Kenvil - Kenvil, NJ

Enclosed are the analytical results for the samples received by the laboratory on the dates listed on the following page(s).

The results in this report apply to the samples analyzed in accordance with the chain of custody document. These results are in compliance with the 2009 NELAC Standards and the appropriate agencies listed below, unless otherwise noted in the case narrative. This analytical report should be reproduced in its entirety.

If you have any questions concerning this report, please feel free to contact me.

A174910 CASE NARRATIVE

Sample Receipt Information:
2 samples were received on 12/07/2017. Samples were received at 2.3 degrees Celsius. Samples were received in acceptable condition.

Please see the chain of custody (COC) document at the end of this report for additional information.

A175011 CASE NARRATIVE

Sample Receipt Information:
164 samples were received on 12/13/2017. Samples were received at 2.1 degrees Celsius. Samples were received in acceptable condition.

Samples were kept frozen by the client from the date of collection until 12/11/17. Samples A175011-BF and A175011-BI were kept frozen at Pace Analytical from 12/13/17 until the time of extraction.

Please see the chain of custody (COC) document at the end of this report for additional information.

Continuing Calibration Verification (CCV):
The LC footnote on sample A175011-86 states that there was a low CCV recovery for HMX. The lower control limit is 80% and the lowest recovery was 64.5%.

The LC footnote on samples A175011-BF and A175011-BI states that there was a low CCV recovery for HMX. The lower control limit is 80% and the lowest recovery was 73.9%.

Notes and Definitions

X	Precision for the matrix spike duplicate, laboratory control sample duplicate or lab duplicate was outside of control limits.
S	Surrogate recovery was outside of laboratory control limits due to an apparent matrix effect.
M1	Spike recoveries were not evaluated because of elevated levels of the spiked analyte in the parent sample.
M	The matrix spike and/or matrix spike duplicate recovery was outside of the laboratory control limits.
LC	Resuts may be biased low because of low continuing calibration verification (CCV).
D	Data reported from a dilution
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis. If the word 'dry' does not appear after the units, results are reported on an as-is basis.
RPD	Relative Percent Difference

January 24, 2019 NJDEP Meeting Summary Memo and Approval

January 24, 2019

Mr. Kevin Schick
Chief - Bureau of Environmental Evaluation & Risk Assessment
New Jersey Deparment of Environmental Protection
Site Remediation & Waste Management Program
P.O. Box 420
Mail Code 401-05W
Trenton, NJ 08625

Subject: Alliant Tech Systems (PI#000741) – Technical Consultation Summary

Dear Mr. Schick:

Thank you for taking the time to meet with us to discuss the Alliant Tech Systems (a.k.a. Hercules Kenvil Works) facility in Kenvil, New Jersey. On December 5, 2018, representatives of the New Jersey Department of Environmental Protection (NJDEP) and Hercules LLC (Hercules) met to discuss the proposed remediation of 2,4,6-trinitrotoluene (TNT) at Hercules Kenvil Works Facility located in Kenvil, Morris County, New Jersey (Program Interest No. 000741) (the Facility). Attending the meeting were:

- Kevin Schick – NJDEP
- Swati Toppin – NJDEP
- Paul Sanders – NJDEP
- Ed Meeks – Hercules
- Mark Foley – WSP (Licensed Site Remediation Professional)
- John Lucey – O'Brien & Gere
- Scott Larew – Kennedy/Jenks Consultants

The Technical Consultation Attendance Sheet is included as Attachment 1.

The meeting objective was to build consensus on the technical scope, regulatory approach, and site-specific cleanup goals associated with the proposed TNT Area remedy. Hercules provided an overview of the proposed remedy for TNT in soil and groundwater that included a summary of academic research, treatability studies, and field pilot studies that yielded Facility-specific data relative to the biodegradation of TNT and its metabolites. This data provided the technical basis for the proposed remedies.

The proposed remedy includes:

- Ex-situ soil preparation (grain size reduction) and bioremediation to reduce TNT source mass and achieve TNT concentrations between the NJDEP's Residential and Non-Residential Direct Contact Soil Remediation Standard (21 to 95 milligrams per kilogram [mg/kg]) after a single treatment season.
- Bioremediation amendment will be mixed with the soil at the base of the excavation (in accordance with NJPDES permit conditions); then excavations will be backfilled with bioremediated material.

WSP USA
3rd Floor
2000 Lenox Drive
Lawrenceville, NJ 08648

Tel.: +1 609 512-3500
Fax: +1 609 512-3600
wsp.com

- Pilot study data indicates that TNT continues to biodegrade in-situ following backfilling. TNT concentration reductions to at or below 1 mg/kg and less are anticipated.
- Long-term monitoring of TNT and its metabolites in soil to demonstrate bioremediation effectiveness
- Long-term monitoring of TNT and its metabolites in groundwater to demonstrate decreasing trends in concentration and plume extent

Hercules requested NJDEP's guidance on the establishment of a site-specific impact to groundwater soil remediation standard (SSIGWSRS) to guide remedial planning and remedial action work plan preparation. The discussion of the SSIGWSRS addressed two factors, the means of developing the value, and the utility of the value in the regulatory and remedial processes.

Method of SSIGWSRS Development

Hercules discussed the results of efforts to develop a SSIGWSRS for TNT using the standard NJDEP tools (i.e., synthetic precipitate leachate procedure (SPLP) spreadsheets, and SESOIL/AT123D modeling) and associated NJDEP guidance documents. NJDEP acknowledged the inherent variability associated with characterizing a solid (crystalline TNT) in a solid matrix (soil), and the influences of that variability on the SPLP method for developing a SSIGWSRS. Hercules indicated that they were unable to establish a predictable relationship between TNT concentrations in soil and associated SPLP leachate, and outlined steps taken in coordination with the analytical laboratory to reduce variability during the preparation and analysis.

NJDEP spoke to the SESOIL/AT123D model framework and the types of constituents the model is intended to assess. Specifically, NJDEP indicated that the model was developed to address highly mobile constituents (i.e., volatile organic compounds [VOCs]) that rapidly flush from soil and migrate through the vadose zone to groundwater. When discussing the potential use of the model to estimate TNT migration over time, NJDEP indicated that while TNT is soluble, its physiochemical properties cause it to move through the vadose zone and into groundwater at a rate well below that of VOCs and the range of rates contemplated during development of the model. NJDEP and Hercules agreed that the SESOIL/AT123D model is not the appropriate tool for developing a SSIGSWSRS for TNT.

Role of SSIGWSRS in Remedial Process

NJDEP understood Hercules' proactive effort to address the impact to groundwater pathway and remediation standard, and indicated that the involvement of their IGW technical staff may be premature given where the project is in the remedial process. NJDEP also noted the reduced reliance on a SSIGWSRS in instances where groundwater contamination already exists, such as this case. The parties agreed that the study results to date justify the proposed remedy, and are sufficient to support development of a remedial action work plan. Following active remediation of soil and monitoring of concentration trends in groundwater, Hercules will consult with NJDEP regarding development of a post-remediation site-specific impact to groundwater standard in the future.

As discussed, Hercules is working with Mark Romanell to resolve comments on the May 2016 Remedial Investigation Report – Groundwater, and move the CEA through the approval process. Hercules will provide milestone updates to the meeting attendees as the remedial action planning and implementation process proceeds.

Sincerely,

Mark Foley
Practice Leader

Ed, John, and Scott,

Please see note below from NJDEP regarding our technical consult meeting.

Ed, you will want to keep a record of this in your files along with the memo (attached).

Thanks
Mark

Section 1: Introduction

On behalf of Hercules LLC (Hercules), Kennedy Jenks Consultants Inc. (KJ) prepared this *TNT Project Area Soil Secondary Constituents of Concern Technical Memorandum* (Secondary COC Memo) presenting an evaluation of the TNT Project Area dataset for constituents that merit consideration as constituents of concern (COCs) in remedial planning beyond the target constituents[1]. This Secondary COC Memo supports the *TNT Project Area Soil Remedial Action Work Plan* (TNT RAWP) and focuses on the TNT Project Area of the Hercules Kenvil Works Facility, located in Kenvil, Morris County, New Jersey (the Facility; **Figure 1**).

1.1 Purpose and Objectives

The purpose of this memorandum is to identify constituents, beyond the target constituents, that will be retained as COCs for further evaluation following implementation of the remedy proposed in the TNT RAWP to address target constituents. This Secondary COC Memo evaluated the TNT Project Area dataset using methods established by NJDEP in the *Technical Guidance for the Attainment of Remediation Standards and Site-Specific Criteria* (Attainment Guidance) (New Jersey Department of Environmental Protection [NJDEP] 2012) and the *Guidance for the Evaluation of Immobile Chemicals for the Impact to Groundwater Pathway* (IC Guidance) (NJDEP 2008) to reduce the list of secondary COCs within the TNT Project Area. Additionally, this memorandum calculates the extent of each secondary COC within the TNT Project Area, and identifies COCs within and outside of the anticipated excavation areas identified in the TNT RAWP. This information will be used to support remedial planning during the implementation of the TNT RAWP. The remainder of this memorandum details the compliance evaluation process and results. A discussion of compliance evaluation results is also presented in **Section 3** of the TNT RAWP.

[1] As defined in the TNT RAWP, target constituents include: 2,4,6-trinitrotoluene (TNT), 2,4-dinitrotuoluene (2,4-DNT), 2,6-dinitrotoluene (2,6-DNT), 2-amino-4,6-dinitrotoluene (2-ADNT), and 4-amino-2,6-dinitrotoluene (4-ADNT).

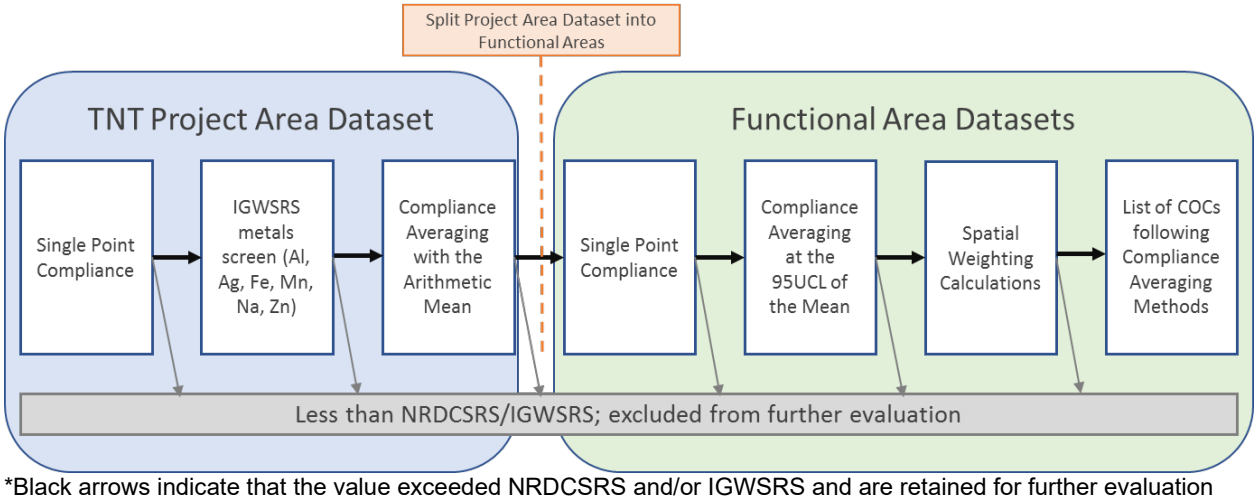
Section 2: Compliance Evaluation Methods

This compliance evaluation relies on the methods established in the NJDEP's *Remediation Standards* (New Jersey Administrative Code [N.J.A.C.] 7:26D) and Attainment Guidance encourages the use of, and provides multiple methods for, compliance averaging to demonstrate attainment of remediation standards and identify constituents requiring remediation.

The compliance evaluation to identify secondary COCs within the TNT project area followed the direct contact (NRDCSRS) and impact to groundwater (IGWSRS) pathways, as required by the Attainment Guidance. The direct contact pathway was evaluated using NRDCSRS based on the anticipated future use of the Facility as a commercial/industrial site, as dictated by a restrictive covenant (i.e., deed notice) that will be established by Hercules as part of Facility remediation.

The flow chart presented below visually represents the step-wise compliance averaging process outlined in **Sections 2.1** and **2.2**. Constituents that exceeded NRDCSRS and/or IGWSRS at a particular step were carried through to the next step in the sequence. Constituents that were less than NRDCSRS and/or IGWSRS at any stage of the process were then excluded from further evaluation. The compliance averaging process began with an evaluation of the full TNT Project Area dataset. Following the compliance evaluations required for the full dataset (**Section 2.1**), the dataset was separated by functional areas (**Section 2.2.1**) for the direct contact and impact to groundwater pathways, as required by the Attainment Guidance. These smaller datasets were then evaluated using the sequential steps illustrated below (i.e., single point compliance, compliance averaging at the 95th upper confidence level of the mean [95UCL], and spatial weighting). The process visualized in the flow chart below represents both the direct contact and impact to groundwater pathways. Any constituents remaining following this compliance evaluation were identified as COCs within their respective functional areas.

Figure A – Compliance Averaging Sequence



*Black arrows indicate that the value exceeded NRDCSRS and/or IGWSRS and are retained for further evaluation

Following the completion of the compliance averaging process, the COCs identified in the impact to groundwater pathway were evaluated using the IC Guidance. This guidance provides procedures that can be used to evaluate potential impacts to groundwater from immobile

constituents. The immobile constituent evaluation (**Section 2.3**) reviews the TNT Project Area soil data for any immobile constituents within the list of COCs identified by the impact to groundwater pathway of the compliance averaging process. Any sample locations with vertical delineation greater than 2 feet from groundwater was excluded from further evaluation.

Tables and figures to support this narrative are referenced accordingly.

2.1 TNT Project Area Dataset Evaluation

Compliance evaluation methods used to evaluate the TNT Project Area dataset are detailed in the following sections. The sections are presented in the step-wise order in which the methods were applied (**Figure A**).

2.1.1 Single Point Compliance

Single point compliance compares the maximum detected concentration for each constituent in the TNT Project Area soil dataset (n= ~400) (**Exhibit 1**) to their respective NJDEP non-residential direct contact soil remediation standard (NRDCSRS) and impact to groundwater soil remediation standard (IGWSRS). Screening results were evaluated as follows.

Direct Contact:

- Constituents with a maximum concentration less than or equal to their NRDCSRS demonstrate attainment of NRDCSRS and do not require further evaluation
- Constituents with a maximum concentration greater than their NRDCSRS require further compliance evaluation

Impact to Groundwater:

- Constituents with a maximum concentration less than or equal to their IGWSRS demonstrate attainment of IGWSRS and do not require further evaluation
- Constituents with a maximum concentration greater than their IGWSRS require further compliance evaluation

Exhibit 1 presents the TNT Project Area dataset screened against NRDCSRS and IGWSRS. **Table 1** presents constituents with maximum detected concentrations exceeding IGWSRS and/or NRDCSRS within the TNT Project Area.

2.1.2 Metals Remediation Standards Evaluation

NJDEP's Ground Water Quality Standards (GWQS) for aluminum, manganese, silver, and zinc are secondary standards based on aesthetic considerations (e.g., odor, taste, appearance), not human health toxicological endpoints. GWQS are used to back-calculate IGWSRS, and per NJDEP Impact to Groundwater Guidance (NJDEP 2014), IGWSRS must be based on health considerations (i.e., human toxicological endpoints). As such, the compliance evaluation for the impact to groundwater pathway excludes aluminum, manganese, silver, and zinc.

Table 1 notes the elimination of these constituents from the impact to groundwater pathway compliance evaluation.

2.1.3 Compliance Averaging Using the Arithmetic Mean

Consistent with the Attainment Guidance, compliance averaging using the arithmetic mean was used in situations where the dataset contained two or fewer distinct sample values or 9 or fewer total sample points for a constituent within the TNT Project Area.

Where a constituent's arithmetic mean exceeded the comparison criterion (i.e., NRDCSRS or IGWSRS), the constituent was retained for further evaluation using functional areas (Section 2.2).

An arithmetic mean less than or equal to the comparison criterion demonstrate attainment of the applicable remediation standard (i.e., NRDCSRS or IGWSRS), and that constituent does not require further evaluation.

Table 1 identifies constituents evaluated via this method and the associated screening results.

2.2 Functional Area Dataset Evaluation

Following the TNT Project Area dataset evaluation, the dataset was segregated by functional areas to calculate a compliance average that is protective of human health across an exposure area of a prescribed size. Each functional area dataset was evaluated using the methods illustrated in Figure A (i.e., single point compliance, 95UCL of the mean, and spatial weighting). The evaluation focused on the constituents retained following the TNT Project Area-wide screening evaluation (Section 2.1).

The following sections detail these methods.

2.2.1 Functional Areas

Consistent with the Attainment Guidance, functional areas were established within the TNT Project area to evaluate direct contact compliance with NRDCSRS (29 functional areas; **Figure 2**) and compliance with IGWSRS (23 functional areas; **Figure 3**). The datasets for each direct contact functional area were separated into two depth strata (Shallow: 0 to 2 feet below ground surface [ft bgs]; and Deep: greater than 2 ft bgs). The segregation of the data between depth strata within the IGWSRS functional areas required consideration of TNT Project Area topography (**Figure 3**). To account for topographic changes across functional areas, ground surface and groundwater table elevations were assigned to each sample location based on the nearest topographic (**Figure 3**) and potentiometric surface (**Figure 4**) contour lines. The use of groundwater table elevation data from the January 2019 event (**Figure 4**) provides a conservative assessment based on seasonal groundwater table elevation fluctuations and higher than normal precipitation amounts and corresponding groundwater elevations throughout 2018. Sample depth intervals were converted to elevations based on the estimated ground surface elevation for the sample location, and sample data were assigned a depth stratum (i.e., Shallow: more than 2 feet above the groundwater table; Deep: samples within 2 feet of the groundwater table) accordingly based on the location-specific estimated groundwater table elevation. In some areas, vertical delineation was achieved well above the groundwater table, and no samples were collected in

the deep stratum. Additionally, in some areas the groundwater table was within two feet of the ground surface, and no shallow stratum existed.

2.2.2 Functional Area Single Point Compliance

Maximum detected constituent concentrations from each functional area/stratum dataset were compared to their respective SRS for direct contact (i.e., NRDCSRS) or impact to groundwater (i.e., IGWSRS) pathway.

Where a constituent's maximum detected concentration exceeded the comparison criterion (i.e., NRDCSRS or IGWSRS), the constituent was retained for further evaluation of that functional area/stratum (Section 2.2.3).

A maximum detected concentration less than or equal to the comparison criterion demonstrate attainment of the applicable remediation standard (i.e., NRDCSRS or IGWSRS), and that constituent requires no further evaluation.

Tables 2 and **3** present functional area data screening tables for the direct contact and impact to groundwater pathways, respectively; corresponding datasets are presented in **Exhibits 2** and **3**.

2.2.3 Compliance Averaging at the 95 Percent Upper Confidence Limit of the Mean

In accordance with the Attainment Guidance, compliance averaging at the 95UCL was conducted for those constituents retained during the functional area dataset screen (**Section 2.2.2**).

Given the number of constituents and functional areas being considered, the evaluation included an additional screening step using the arithmetic mean. A comparison of the arithmetic mean of the functional area dataset to NRDCSRS and IGWSRS was used to identify those constituents whose 95UCL would exceed the screening criterion (95UCL of the mean is always greater than the arithmetic mean or average), no constituents were ruled out based on this screening. Where the arithmetic mean equaled or exceeded an SRS, it was inferred that the 95UCL value would also exceed SRS, and the constituent proceeded directly to evaluation by spatial weighting (**Section 2.2.4**). If the arithmetic mean was less than SRS, the constituent proceeded to 95UCL calculation. While not called for in the Attainment Guidance, this conservative evaluation streamlined the 95UCL calculation and screening process.

The arithmetic mean screening step managed functional area datasets as follows:

- Constituents with fewer than 10 samples within a functional area were retained for spatial weighting (**Section 2.2.4**), as the Attainment Guidance requires a minimum of 10 samples (including detects and non-detects) for the use of 95UCL.

- The arithmetic mean was calculated for constituents with 10 or more samples.

    - Detected values were used to calculate the arithmetic mean when 10 or more detect values exist.

- The entire dataset was used to calculate the arithmetic mean when fewer than 10 detected values exist, with half of the detection limit representing non-detect (ND) values.

Following identification of constituents requiring evaluation via 95UCL compliance averaging, 95UCL calculations were performed using the ProUCL software application (Version 5.1.002).

The 95UCL compliance averaging step managed functional area datasets as follows:

- Detected values were used to calculate the 95UCL when 10 or more detect values exist.
- The entire dataset was used to calculate the 95UCL when fewer than 10 detected values exist, with half of the detection limit representing ND values.

Constituents with 95UCLs less than or equal to SRS attained compliance and no further evaluation was required. Constituents with 95UCLs exceeding SRS were retained for evaluation by spatial weighting (**Section 2.2.4**).

Tables 2 and **3** summarize the results of the arithmetic mean screen and 95UCL compliance averaging for the direct contact and impact to groundwater pathways, respectively. **Exhibits 4** and **5** present the associated ProUCL output files.

2.2.4 Spatial Weighting Using Thiessen Polygons

In accordance with the Attainment Guidance, spatially-weighted averaging (area-weighted mean) can be used for direct contact and impact to groundwater exposure pathways to identify constituents requiring remediation. Functional areas used in this evaluation were the same as those defined in **Section 2.3**. This process weights the sample results according to the portion of the functional area they represent using Thiessen polygons[2].

Spatial-weighting calculations were performed using GIS software. For each functional area, GIS created Thiessen polygons around each sample. The reporting limit was used for non-detect values. Constituent concentrations were weighted proportional to the fraction of the overall area their polygon represents, and the fractional contributions added to generate a value representative of the entire functional area.

Area-weighted mean constituent concentrations less than or equal to SRS attained compliance and no further evaluation was required. Constituents with area-weighted mean values exceeding SRS were identified as COCs requiring remediation.

Tables 2 and **3** summarize spatial-weighting compliance averaging results. **Exhibits 6** and **7** present direct contact pathway data tables and COC-specific figures illustrating Thiessen polygon boundaries and areas, respectively. **Exhibits 8** and **9** present impact to groundwater pathway data tables and COC-specific figures illustrating Thiessen polygon boundaries and areas, respectively.

[2] Thiessen polygons are polygons whose boundaries define the area that is closest to each point relative to all other points; mathematically defined by the perpendicular bisectors of the lines between all points.

2.3 Immobile Constituents Evaluation

The COCs retained following spatial weighting evaluation (**Section 2.2.4**) for the impact to groundwater pathway were evaluated using the IC Guidance to evaluate their proximity to the groundwater table. Immobile constituents have a low transport potential due to high soil adsorption coefficients, and do not pose a threat to groundwater if 2-foot zone of clean soil exists between the constituent and groundwater. The NJDEP identifies a list of 31 chemicals as immobile constituents, that are likely to be strongly adsorbed to soil and are, under certain conditions, not likely to impact groundwater (NJDEP 2008).

The immobile constituent evaluation focused only on the shallow functional area results, as samples in the deep stratum are within 2 feet of groundwater. Lead represents the only immobile constituent identified in the shallow stratum in at least one functional area. **Section 3.3** summarizes the results of the evaluation of lead as an immobile constituent in select functional areas.

Section 3: Results

3.1 Direct Contact Compliance Averaging

The results of direct contact compliance evaluation identified 3 COCs exceeded NRDCSRS in the shallow (0 to 2 ft bgs) depth interval in 9 functional areas. **Table 2** presents the results of each stage of the compliance averaging process; these results are summarized below.

Functional Area	Lead	Arsenic	Nitroglycerin
1 - Shallow	x		
3 - Shallow	x		
5 - Shallow	x	x	
8 - Shallow	x	x	
9 - Shallow	x	x	
10 - Shallow	x		
19 - Shallow	x	x	
21 - Shallow	x		
27 - Shallow			x

x – indicates that the COC exceeds NRDCSRS within the functional area

3.2 Impact to Groundwater Compliance Averaging

The results of impact to groundwater compliance averaging identified 8 COCs within 10 shallow and 8 deep functional areas that exceeded IGWSRS. **Table 3** presents the results of each stage of the compliance averaging process; these results are summarized below.

Functional Areas	1,3-Dinitrobenzene	Nitrobenzene	Arsenic	Copper	Lead	Mercury	Nickel
5 - Shallow	x	x			x		
6 - Shallow					x		
7 - Shallow	x	x	x		x		
8 - Shallow	x		x		x	x	
9 - Deep			x		x	x	
10 - Shallow	x				x		
10 - Deep					x		
11 - Deep		x	x		x	x	
12 - Shallow					x		
13 - Shallow					x		
13 - Deep					x		
15 - Shallow					x		
15 - Deep					x		
16 - Shallow					x	x	
16 - Deep				x	x		x
17 - Deep						x	
18 - Deep	x						
19 - Shallow	x						

x – indicates that the COC exceeds IGWSRS within the Functional Area

3.3 Immobile Constituents Evaluation Results

The spatial weighting evaluation identified soil samples that drive the spatially-weighted exceedance (also discussed in **Section 4**). For shallow lead, 33 samples were identified as drivers of the spatially-weighted exceedance in 9 of the impact to groundwater functional areas. To evaluate lead as an immobile constituent within the TNT Project Area, the soil data for the 33 identified sample locations at all available depths was compiled and compared to its relative depth to groundwater (**Table 4**). Any sample location with vertical delineation greater than 2 feet from groundwater was excluded from further evaluation.

The results of the immobile constituent evaluation identified lead in soil at 8 sample locations vertically delineated at a depth greater than 2 feet from groundwater.

- TP-R-C10-439-1
- TP-R-C10-439-3
- TP-R-B10-2/B10-509-2
- TP-R-B10-2/B10-509-6
- TP-R-B10-508-4
- SB-R-B11-02
- TP-R-A11-504-1
- TP-R-A11-5-1

Table 4 presents the lead immobile constituent evaluation. **Figure 5** illustrates the eight sample locations listed above. Further discussion of these samples and their distribution relative to the TNT remedy is presented in **Section 4**.

Section 4: Influences of/on Remedy Implementation

The TNT Project Area remedy focuses on target constituents. The influence of the bioremediation remedy on these comingled secondary COCs requires an understanding of which comingled secondary COCs occur within areas of anticipated excavation presented in **Appendix H** of the TNT RAWP, as well as the influence of individual sample locations on spatially-weighted functional area concentrations. This information also informs decision making regarding the need for, and scope of, supplemental sampling activities.

A desktop evaluation identified samples driving the spatially weighted average concentrations exceeding SRS, and their locations relative to areas of anticipated excavation.

This assessment relied on an iterative process whereby the highest spatially-weighted concentration is replaced with zero and the influence of that change is evaluated by recalculating the spatially-weighted average for the functional area. This process was repeated until the spatially-weighted average concentration was less than the SRS for the subject pathway. Sample replaced in order to achieve SRS represent drivers of exceedance (or exceeding sample) for that functional area.

Constituent-specific figures illustrate the exceeding samples within each functional area and their location respective to anticipated excavation areas. **Figures 6** through **8** present constituent-specific figures for the direct contact compliance averaging evaluation. **Figures 9** through **20** present constituent- and depth-specific figures for the impact to groundwater compliance averaging evaluation.

Figure 9 presents exceeding samples for lead in the shallow strata across functional areas. The immobile constituent evaluation was not applied to sample locations that occur within anticipated excavation areas, as remedy implementation (i.e., excavation, treatment, and backfilling) will alter the depth and composition of the material at the existing sample location. Lead was identified as an immobile constituent at 2 locations (TP-R-C10-439-1 and TP-R-C10-439-3) occurring outside of excavation areas. As such, lead is no longer considered a COC at these locations.

Tables 5 and **6** present a summary of the excavation areas affected and the exceeding sample ID(s) for the direct contact and impact to groundwater evaluations, respectively. The following table summarizes results of this evaluation.

Secondary COC	Depth	Exceeding Sample in Excavation Area?	
		Direct Contact	*Impact to Groundwater*
Lead	Shallow	Y	Y
	Deep	--	Y
Arsenic	Shallow	Y	Y
	Deep	--	N
Mercury	Shallow	--	N
	Deep	--	N
Copper	Deep	--	N
Nickel	Deep	--	N
1,3-Dinitrobenzene	Shallow	--	Y
	Deep	--	Y
Nitrobenzene	Shallow	--	Y
	Deep	--	N
Nitroglycerin	Shallow	Y	--

'Y' = yes, 'N' = no, '--' = not applicable

Exceeding samples occur both within and beyond anticipated excavation areas (**Figures 6** through **20**). A discussion of these results and associated conclusions are presented in the following section.

Section 5: Discussion and Conclusions

This Secondary COC Memo identifies secondary COCs and defines their distribution within the TNT Project Area. Secondary COCs include:

COC	Direct Contact		Impact to Groundwater	
	Shallow	***Deep***	***Shallow***	***Deep***
1,3-Dinitrobenzene	X*		X*	X*
Nitrobenzene	X*		X*	X
Nitroglycerin				
Arsenic			X*	X
Copper				X
Lead	X*		X*	X*
Mercury			X	X
Nickel				X

* indicates that at least one exceeding sample coincides with an excavation area

The influences of remedy implementation on secondary COCs are expected to include:

- Bioremediation of energetic and explosive secondary COCs occurring in excavation areas
- Re-distribution of certain secondary COCs occurring in excavation areas
- No disturbance to secondary COCs at certain locations within the TNT Project Area

Acknowledging these influences, remedial strategies for secondary COCs within the TNT Project Area will be re-evaluated following remedy implementation.

Notes:
IGWSRS = Impact to Groundwater Soil Remediation Standard
RDCSRS = Residential Direct Contact Soil Remediation Standard
NRDCSRS = Non-Residential Direct Contact Soil Remediation Standard
ug/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
ND = non-detect
* Arithmetic Average (ND=0) only run for constituents with two or fewer detections, as per NJDEP Compliance Averaging Regulations
SVOC = semi-volatile organic compound
VOC = volatile organic compound
