			Notes			
Chemical	CAS Number	Units	IGWSRS			
Explosives						
1,3-Dinitrobenzene	99-65-0	ug/kg	500	< 110	< 110	< 110
Nitrobenzene	98-95-3	ug/kg	200	< 110	< 110	< 110
Metals						
Antimony	7440-36-0	mg/kg	6	NA	NA	NA
Arsenic	7440-38-2	mg/kg	19	NA	NA	NA
Beryllium	7440-41-7	mg/kg	1.08	NA	NA	NA
Cadmium	7440-43-9	mg/kg	2	NA	NA	NA
Copper	7440-50-8	mg/kg	11000	NA	NA	NA
Lead	7439-92-1	mg/kg	90	NA	NA	NA
Mercury	7439-97-6	mg/kg	0.32	NA	NA	NA
Nickel	7440-02-0	mg/kg	48	NA	NA	NA
Selenium	7782-49-2	mg/kg	11	NA	NA	NA
Thallium	7440-28-0	mg/kg	3	NA	NA	NA
SVOCs						
Benzo[a]pyrene	50-32-8	ug/kg	3000	NA	NA	NA
N-Nitrosodiphenylamine	86-30-6	ug/kg	6000	NA	NA	NA

Notes:
Exceeds Impact to Groundwater Soil Remediation Standard (IGWSRS)
Exceeds Residential Direct Contact Soil Remediation Standard (RDCSRS)
Exceeds Non-Residential Direct Contact Soil Remediation Standard (NRDCSRS)
mg/kg = milligrams per kilogram
ug/kg = micrograms per kilogram
SVOCs = semivolatile organic compounds
NA = not analyzed
< = non-detect. The value presented is the reporting limit
J = The analyte has a concentration below the reporting limit (lowest point of the calibration curve) and is an estimated value.

Suggested UCL to Use

95% Adjusted Gamma UCL	954.3

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

nu hat (MLE)	4.309	nu star (bias corrected)	3.057
Mean (detects)	807		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	239.1
Maximum	3600	Median	0.01

Suggested UCL to Use

Adjusted KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	998.7

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Nonparametric Distribution Free UCL Statistics

Data do not follow a Discernible Distribution at 5% Significance Level

Suggested UCL to Use

KM Bootstrap t UCL	N/A

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

nu hat (MLE)	32.59	nu star (bias corrected)	N/A
Mean (detects)	510		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	102
Maximum	840	Median	0.01
SD	237.2	CV	2.326

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

95% KM Approximate Gamma UCL	311.4	95% GROS Approximate Gamma UCL	244.7

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Nitrobenzene

General Statistics

Total Number of Observations	42	Number of Distinct Observations	13
		Number of Missing Observations	48
Number of Detects	0	Number of Non-Detects	42
Number of Distinct Detects	0	Number of Distinct Non-Detects	13

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!

Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!

The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Nitrobenzene was not processed!

Nonparametric Distribution Free UCL Statistics

Detected Data appear Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL	0.127

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% Student's-t UCL	9.356

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Theta hat (MLE)	0.198	Theta star (bias corrected MLE)	0.235
nu hat (MLE)	70.66	nu star (bias corrected)	59.52
Mean (detects)	0.412		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.213

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL	1.007

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Thallium

General Statistics

Total Number of Observations	19	Number of Distinct Observations	18
		Number of Missing Observations	63
Number of Detects	0	Number of Non-Detects	19
Number of Distinct Detects	0	Number of Distinct Non-Detects	18

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Thallium was not processed!

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	216.9

97.5% Chebyshev(Mean, Sd) UCL	0.843	99% Chebyshev(Mean, Sd) UCL	1.059

Suggested UCL to Use

95% Student's-t UCL	0.586

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.146

nu hat (MLE)	6.375	nu star (bias corrected)	3.883
Mean (detects)	920		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	460

Suggested UCL to Use

95% KM Bootstrap t UCL	2292	ı Adjusted KM-UCL (use when k<=1 and 15 < n < 50 but k<=1	2660

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

N-Nitrosodiphenylamine

General Statistics

Total Number of Observations	10	Number of Distinct Observations	9
		Number of Missing Observations	1
Number of Detects	1	Number of Non-Detects	9
Number of Distinct Detects	1	Number of Distinct Non-Detects	8

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable N-Nitrosodiphenylamine was not processed!

UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Date/Time of Computation	ProUCL 5.15/21/2019 10:31:55 AM
From File	Functional Area 12 S.xls
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

Dinitrobenzene

General Statistics

Total Number of Observations	19	Number of Distinct Observations	8
		Number of Missing Observations	6
Number of Detects	1	Number of Non-Detects	18
Number of Distinct Detects	1	Number of Distinct Non-Detects	7

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Dinitrobenzene was not processed!

Nitrobenzene

General Statistics

Total Number of Observations	14	Number of Distinct Observations	7
		Number of Missing Observations	11
Number of Detects	0	Number of Non-Detects	14
Number of Distinct Detects	0	Number of Distinct Non-Detects	7

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Nitrobenzene was not processed!

Antimony

General Statistics

Total Number of Observations	9	Number of Distinct Observations	9
		Number of Missing Observations	4
Number of Detects	2	Number of Non-Detects	7

Nonparametric Distribution Free UCL Statistics

Detected Data appear Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL	0.714

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Copper

General Statistics

Total Number of Observations	9	Number of Distinct Observations	9
		Number of Missing Observations	4
Minimum	7.27	Mean	81.78
Maximum	644	Median	10
SD	210.9	Std. Error of Mean	70.29
Coefficient of Variation	2.579	Skewness	2.997

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use

guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 665.3

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

N-Nitrosodiphenylamine

General Statistics

Total Number of Observations	13	Number of Distinct Observations	9
		Number of Missing Observations	2
Number of Detects	0	Number of Non-Detects	13
Number of Distinct Detects	0	Number of Distinct Non-Detects	9

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable N-Nitrosodiphenylamine was not processed!

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% KM (t) UCL 481.8

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

N-Nitrosodiphenylamine

General Statistics

Total Number of Observations	16	Number of Distinct Observations	7
		Number of Missing Observations	1
Number of Detects	0	Number of Non-Detects	16
Number of Distinct Detects	0	Number of Distinct Non-Detects	7

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable N-Nitrosodiphenylamine was not processed!

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.689	Mean	1.114
Maximum	1.59	Median	1.013
SD	0.303	CV	0.272
k hat (MLE)	15.24	k star (bias corrected MLE)	11.49

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

97.5% Chebyshev(Mean, Sd) UCL	13.5	99% Chebyshev(Mean, Sd) UCL	17.24

Suggested UCL to Use

95% Student's-t UCL	9.014

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

95% H-UCL	46.9

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Suggested UCL to Use

95% Student's-t UCL	10.04

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL	0.758

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

97.5% Chebyshev(Mean, Sd) UCL	5.232	99% Chebyshev(Mean, Sd) UCL	5.843

Suggested UCL to Use

95% Student's-t UCL	4.501

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.435	Mean	0.829

Thallium

General Statistics

Total Number of Observations	11	Number of Distinct Observations	4
		Number of Missing Observations	1
Number of Detects	0	Number of Non-Detects	11
Number of Distinct Detects	0	Number of Distinct Non-Detects	4

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Thallium was not processed!

Suggested UCL to Use

95% Adjusted Gamma UCL	105.6

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Section 1: Introduction

On behalf of Hercules LLC (Hercules), Kennedy/Jenks Consultants Inc. (KJ) has prepared this *TNT Soil Remediation Process Confirmation Sampling Plan* (PCSP) outlining the approach, objectives and scope of process confirmation sampling of soil undergoing bioremediation as part of the TNT soil remedy at Hercules' Kenvil Works Facility, located in Kenvil, Morris County, New Jersey (the Facility). This PCSP supports the *TNT Project Area Soil Remedial Action Work Plan* (TNT RAWP).

The TNT RAWP proposes to treat soil in biocells (i.e., engineered treatment cells) for approximately 10 to 12 months before using treated material as backfill in the source excavation areas, where target constituents will undergo additional biological degradation in-situ. Consistent with the TNT RAWP, target constituents include 2,4,6-trinitrotoluene (TNT), 2,4-dinitrotoluene (2,4-DNT), 2,6-dinitrotoluene (2,6-DNT), 2-amino-4,6-dinitrotoluene (2-ADNT), and 4-amino-2,6-dinitrotoluene (4-ADNT).

This PCSP provides a sampling program to document the continued decrease in target constituent concentrations in soil undergoing treatment in the biocells, and characterize processed (oversize) and treated (fines) material to facilitate use as backfill in TNT Project Area excavations. Specifically, the PCSP sampling program outlined herein:

- Establishes sampling goals and success criteria
- Outlines a sampling plan to characterize material being treated in biocells and oversize material washed and segregated by the soil processing plant
- Presents a monitoring, milestone, and reporting schedule

Monitoring related to soil processing plant optimization and long-term monitoring of treated soil backfilled in excavation areas is beyond the scope of this document and will be addressed in separate monitoring plans.

Section 2: Overview & Approach

2.1 Treatment Process Overview

The TNT bioremediation pilot study and preliminary soil process plant design defined the soil preparation process, biofeed moisture content, DARAMEND OE® dosing and dose frequency, and seasonal timing, that created the proper soil temperature, pH, and redox potential conditions to promote efficient biodegradation of target constituents. Under these conditions, pilot study data indicated that target constituents degraded to below the New Jersey Department of Environmental Protection's (NJDEP's) non-residential direct contact soil remediation standards (NRDCSRS) in 9 to 12 weeks. These degradation rates provide a basis for the remedy proposed in the TNT RAWP and the sampling approach outlined in this PCSP. **Attachments 3** and **6** to the TNT RAWP present the *TNT Bioremediation Pilot Study Report* and *TNT Soil Bioremediation Project Preliminary Design Drawings*, respectively.

The TNT Project Area remedy is effectively a scaled-up version of this pilot study with a more robust physical soil preparation process employed to produce material for treatment (biofeed). As such, this process confirmation sampling plan builds on the monitoring approach and procedures used during the pilot study, with adjusted to reflect the scale, scope, and objectives of the full-scale remedy.

2.2 Target Media and Sampling Approach

The soil processing plant will physically prepare material for bioremediation, cleaning and segregating oversize aggregate and creating a homogeneous blend of fine fractions for treatment in biocells. Specifically, the soil processing plant will generate the following three fractions:

- Oversize – Coarse (12.5 millimeters [mm] and greater)
- Oversize – Fine (between 12.5 and 2 mm)
- Biofeed (less than 2 mm, amended with DARAMEND OE®)

The process plant will stockpile washed oversize aggregate in fine and coarse stockpiles. Collectively, these fractions represent about 30 percent of the soil entering the plant. The remaining material passes through the plant, is amended with DARAMEND OE® and pumped to biocells as a homogenous slurry where bioremediation occurs.

This plan outlines a monitoring program that:

- Monitors the progress of bioremediation of the biofeed fraction in the biocells over time
- Characterizes treated biofeed to demonstrate attainment of remedial objectives and facilitate reuse as backfill in excavated areas.
- Characterizes washed, segregated oversize fractions to demonstrate attainment of remedial objectives and facilitate reuse as backfill in excavated areas.

The *TNT Project Area Soil Reuse Plan* (**Appendix F** to the TNT RAWP) supplements the data collection information provided herein and addresses the regulatory requirements associated with onsite reuse of processed materials.

Section 3 and Section 4 outline the oversize and biofeed monitoring programs, respectively.

Section 3: Oversize Characterization Sampling Plan

Characterization of oversize fractions generated by the soil processing plant will facilitate reuse of the cleaned oversize fractions. The coarse (aggregate greater than 12.7mm in diameter) and fine (aggregate greater than 2mm but less than 12.7mm in diameter) oversize materials will be sampled and analyzed to demonstrate the effectiveness of the washing procedure at removing soil containing target constituents that may be adhered to the aggregate. Once confirmed clean (i.e., constituent of concern [COC] concentrations less than NJDEP NRDCSRS), stockpiled material will be moved to a designated area (to be identified during final design) and staged for reuse.

Estimated average plant throughput is 320 tons (T) per processing day (five processing days per week), of which approximately 30 percent (96 T or 64 cubic yards [cy]) is oversize material. The plant will create one stockpile containing approximately 32 cy each day for each oversize fraction. At the end of each processing day, the stockpile will be moved from its location at the end of the radial stacker to a staging area on the processing pad pending characterization. Each staged stockpile will accumulate a week's worth of oversize produced by the plant (~160 cy). Shorter accumulation timeframes may be selected during final design based on available area for stockpiling.

A weekly composite sample (consisting of five daily parts) will be used to characterize the approximately 160 cy of stockpiled material for each oversize fraction. Prior to moving each daily stockpile, one 4-ounce jar of washed, stockpiled oversize material will be collected. After 5 days, aliquots (proportioned by weight) from each of the five 4-ounce aliquots will be combined and mixed together, and a composite sample will be collected in one new 4-ounce jar. Aliquot weights will be calculated based on daily oversize output from the processing plant as measured via a belt scale on the conveyor for each discrete oversize fraction.

The daily oversize samples will be labeled with a sample ID, date and time collected, and sampler's initials, and maintained in a secure onsite freezer under chain of custody procedures.

Samples will be labeled adhering to the following naming convention aligned with the Facility's EQuIS database designations:

- Project identifier: TNT-REM, indicating sample is part of the TNT Project Area remedy
- Sample type: OSC or OSF, indicating the sample consists of oversize – fines fraction (OSF) or oversize coarse fraction (OSC)
- Sample date: MMDDYYY

An example sample ID would be: TNT-REM-OSC-05152020, denoting a TNT Project Area remedy sample consisting of oversize coarse fraction material collected on May 15, 2020.

In the event that multiple samples are collected on the same day, a unique sample number will be added to precede the date. For example, the first sample collected on May 15, 2020 would be logged as TNT-REM-OSC-01-05152020.

Composite samples will be labeled with the sample date followed by a (c).

The weekly composite sample will be shipped in a cooler with ice under chain of custody procedures via FedEx – Priority Overnight to Pace Analytical, a NJ-certified lab located in Madison, Wisconsin (Pace), for analysis, or analyzed by an onsite mobile laboratory operated by Pace. The laboratory will pulverize the aggregate and analyze for constituents of concern as defined in Section 3.3 of the TNT RAWP using the analytical methods that follow.

- Semivolatile Organic Compounds (SVOCs) by United States Environmental Protection Agency (EPA) SW-846 Method 8270C
- Nitroaromatics and Nitramines (E&E) by EPA SW-846 Method 8095
- Target Analyte List (TAL) Metals by EPA SW-846 Method 6010B
- Mercury by EPA SW-846 Method 7471A

Samples will be analyzed on an expedited (e.g., 48-hour) turnaround time such that the stockpile can be confirmed clean (i.e., target constituent concentrations less than NJDEP NRDCSRS) and staged for use as backfill in excavation areas to open up stockpile area on the processing pad for the subsequent week's uncharacterized oversize stockpile(s). Pace will deliver a NJ-reduced (Level II) data deliverable and an electronic data deliverable in a format compatible with the Facility's EQuIS database.

The results will be reviewed and confirmed with the LSRP prior to staging the stockpile(s) as backfill material. In the event that characterization data do not meet NJDEP NRDCSRS, the oversize fraction will be re-run through the processing plant and resampled per the procedures outlined above.

Section 4: Biofeed Bioremediation Sampling Plan

Bioremediation monitoring will generate data to characterize baseline conditions (time 0) and quantify reductions in target constituent concentrations over time and demonstrate compliance with success criteria facilitating reuse as backfill (i.e., NJDEP NRDCSRS). Sampling frequency is based on the degradation rates observed in the pilot study. Excavation, blending, and staging of feed material and process plant design are expected to yield a biofeed product that is physically and chemically homogenous. The data collection approach includes assessment of data similarity both within and between biocells to confirm this expectation. Quantitatively demonstrating homogeneity of target constituent concentrations in biofeed provides a technical basis on which to scope sampling effort during long-term monitoring after material is backfilled in excavation areas.

4.1 Monitoring Frequency

Completing the filling of each biocell will initiate the monitoring program. Based on the results observed during the pilot study, NRDCSRS targets will be attained in approximately 12 weeks (84 days). To confirm the bioremediation is proceeding as planned, a baseline event and three monitoring events will be performed on a 4-week cycle at each bio cell (i.e., Day 0, Day 28, Day 56, and Day 84). Process plant production rate estimates indicate that a biocell will be filled every 11 processing days on average. As such, each biocell will be monitored on its own schedule.

Monitoring will continue irrespective of monitoring results through the Day 84 event. If NRDCSRS targets have been achieved by Day 84, no additional monitoring will occur prior to emptying the biocells the following spring. If NRDCSRS targets have not been attained, sampling will continue on the 4-week cycle until biofeed temperatures drop below 50 degrees Fahrenheit or NRDCSRS are achieved, whichever occurs first. If NRDCSRS have not been attained prior to soil temperatures reaching 50 degrees Fahrenheit, an additional event will be conducted late March or early April of the following year to document attainment of NRDCSRS prior to emptying the biocells.

4.2 Biocell Monitoring Locations

Each of the five bio cells will be assessed as a homogenous unit. Based on the preliminary design drawings (**Attachment 6** to the TNT RAWP), biocell specifications include:

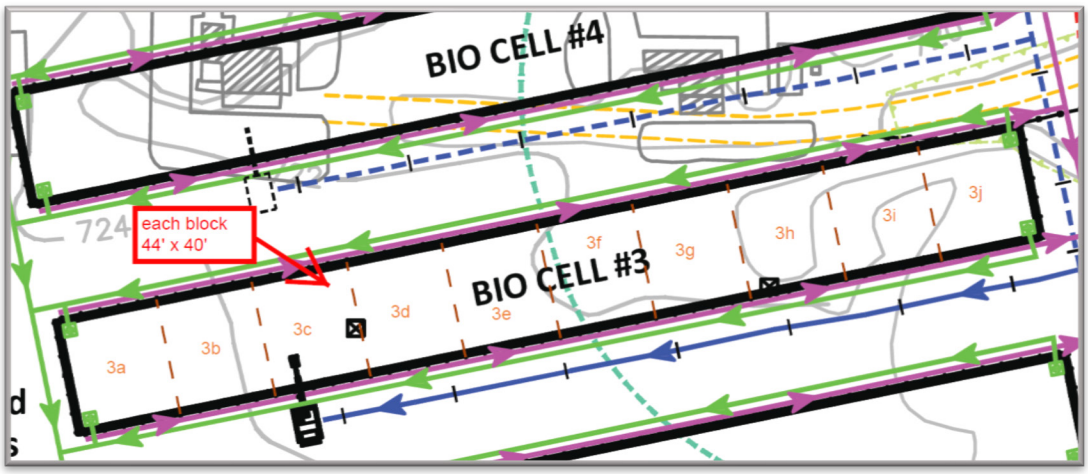
- Internal Dimensions: 402 feet long by 44 feet wide by 6 feet high
- Footprint:17,688 square feet
- Usable Height: 5 feet
- Usable Capacity: 88,440 cubic feet (3,276 cubic yards [cy])

NJDEP Fill Material Guidance for SRP Sites requires that ten samples be collected and analyzed to characterize fill volumes between 3,000 and 4,000 cy (under reduced frequency scenario).

Assuming the biocells are filled to capacity, ten samples of biofeed material will be collected and analyzed during each monitoring event. Bio cell dimensions and volumes are subject to change during final design, and process confirmation sampling will be scaled accordingly for the final design dimensions.

One analytical sample will be collected from each of ten blocks measuring 44 feet wide by 40 feet long by 5 feet high as shown on Figure E-1.

Figure E-1. Bio cell array showing typical subdivision of bio cells.



4.3 Sample Collection & Analysis

Disposable acetate core tubes will be used to collect soil cores from four random locations within each block of the biocell. The full length of the recovered soil core will be composited in the field in a dedicated, decontaminated stainless steel mixing bowl. A single sample of the composited material will be collected to represent that block of the biocell. Using this sampling approach, each biocell (assumed to be at capacity) will be represented by ten composite soil samples.

Samples will be collected in laboratory-provided, certified-clean glassware. Samples will be labeled with sample ID, date and time collected, and sampler's initials, and shipped in a cooler with ice under chain of custody procedures via FedEx – Priority Overnight to Pace Analytical, a NJ-certified lab located in Madison, Wisconsin (Pace), or manually delivered to an onsite mobile Pace laboratory, for analysis.

Requested analyses will be by event as follows:

Sampling Event	*Day 0 (Baseline)*	*Day 28*	*Day 56*	*Day 84*	*Additional 28-day intervals (as necessary)*
SVOCs (EPA SW-846 8270C)	X			X	X*
E&E (EPA SW-846 8095)	X	X	X	X	X
TAL Metals (EPA SW-846 6010B)	X			X	X*
Mercury (EPA SW-846 7471A)	X			X	X*
Total Organic Carbon (Lloyd Kahn)	X			X	X*
Grain Size (Sieve & Hydrometer)	X			X	X*

* samples may be collected and held pending results of E&E analysis

Quality assurance/quality control (QA/QC) samples will be collected at the following frequencies:

- Field equipment blank: 1 per sampling day
- Blind duplicate sample: 1 per 20 field samples
- Matrix spike/matrix spike duplicate samples: 1 per 20 field samples

Samples will be analyzed on a standard (i.e., 10-day) turnaround time. Pace will deliver a NJ-reduced (Level II) data deliverable and an electronic data deliverable in a format compatible with the Facility's EQuIS database.

During biocell sampling, in-situ field probes will be used to collect the following field parameters.

- pH
- temperature (degrees C)
- redox potential / ORP (mV)
- moisture (by visual inspection)

Field measurements will target three depth strata (within 1 foot of biofeed surface, within 1 foot of biocell bottom, and between 2 and 3 feet below biofeed surface). Measurements will be collected at one location per block proximate to the locations where soil samples are collected.

Field data, observations, photographs, and sample collection information will be documented using an automated tablet-based data collection system (i.e., EQuIS Collect, Survey123).

4.4 Sample Nomenclature

Biocells will be numbered sequentially (e.g., 1 through 5) and subdivided into ten blocks a shown on **Figure E-1**. Each block will be assigned a lowercase letter "a" through "j" from west to east.

Thus, each block may be uniquely identified by a biocell number and block letter together (i.e., 2d would denote biocell 2, block d).

Biofeed samples collected for process confirmation will adhere to the naming convention outlined below aligned with the current EQuIS database format. The naming convention deviates from the traditional Facility naming convention as follows:

- Biocells are temporary structures that are not affixed to the sitewide grid system. As such, the grid cell ID will be replaced with biocell number and sampling block references. The syntax of the block ID (number followed by lowercase letter) will differentiate these samples from SI/RI samples affixed to the grid (capital letter followed by number).

- The boring number field will be replaced with the number of treatment days to allow convenient sequential sorting for data tabulations.

An example sample ID may look like the following:

TNT-REM-BIO-4f-56, where:

- TNT-REM = TNT Remediation project
- BIO = biofeed sample
- 4f = Biocell 4, block f
- 56 = Number of days biofeed has been undergoing treatment in biocell

Field sampling procedures will adhere to practices established in the NJDEP Field Sampling Procedures Manual (2005) and Field Quality Assurance Project Plan (Hercules 2005). Laboratory analytical procedures and associated QA/QC will adhere to the Analytical Quality Assurance Project Plan (Hercules 2019, **Appendix E** to the TNT RAWP).

Section 5: Data Evaluation and Reporting

5.1 Data Evaluation

Field measurements will be evaluated immediately following collection. These data will be used to guide biocell water management activities (i.e., pumping of excess water from the biocell to decrease biofeed moisture content or application of process water to increase moisture content). Soil temperature will be used to establish the end of the monitoring season each fall.

Analytical data will be reviewed consistent with NJDEP's *Data Quality Assessment and Data Usability Evaluation Technical Guidance* (2014) and *Data of Known Quality Protocols Technical Guidance* (2014). Data passing these quality reviews will be evaluated to establish time-series trends in target constituent concentrations. Beyond establishing a baseline for monitoring target constituent concentration reductions over time, the Day 0 dataset will provide the plant operators with information regarding excavation/blending/staging effectiveness, process plant homogenization efficiency, and uniformity of DARAMEND OE® distribution in support of plant optimization. Confirmation sampling data will be evaluated in the context of the *TNT Project Area Soil Reuse Plan* (**Appendix F** to the TNT RAWP) facilitating use of treated biofeed as backfill.

In the event that data indicate that bioremediation is not progressing as planned, the need for and scope of corrective actions will be evaluated on a case-by-case basis.

5.2 Reporting

Process monitoring reports will be prepared and submitted annually following confirmation sampling of treated material each spring (following the first season of processing). The reports will:

- Present field observations and measurement data
- Document the decrease in target constituent concentrations over the treatment period
- Address data and/or process observations that present an opportunity to optimize or improve the soil processing plant operation and/or biocell management practices
- Present the confirmation sampling results the demonstrate attainment of the success criteria enabling use of the treated biofeed as backfill (i.e., target constituent concentrations less than NJDEP NRDCSRS)
- Provide an assessment of biofeed homogeneity, both within each biocell and across the biocells, to establish a basis for the sampling approach and frequency for long-term monitoring of biofeed used to backfill the excavations

Upon completion of soil processing and biocell treatment, the information presented in the annual reports will be synthesized in a remedial action report (RAR). The annual reports will be included as attachments to the RAR.

1. INTRODUCTION

This Analytical Quality Assurance Project Plan (AQAPP) has been developed by O'Brien & Gere, a part of RAMBOLL (RAMBOLL), on behalf of Hercules LLC (Hercules) in support of Pre-design Investigations (PDI) at the Former Kenvil Works in Kenvil, New Jersey (Facility). A site location map is provided as Figure 1. The PDI work will include the collection and analysis of groundwater, surface water, soil, sediment, concrete and biological tissue samples collected from the Facility.

This AQAPP presents the organization, objectives, functional activities and specific quality assurance/quality control (QA/QC) activities associated with the sample collection and laboratory analysis of environmental samples. Laboratory QA/QC is a comprehensive program used to define and document the quality of analytical data. QA involves planning, implementation, assessment, reporting and quality improvement to establish the reliability of laboratory data. QC procedures are the tools used to achieve this reliability. This AQAPP defines how QA and QC are applied to the environmental activities at this Facility to assure that the type and quality of data generated for this PDI meet project needs.

This AQAPP has been prepared using the guidance provided in the following documents:

- NJDEP. Readoption December 2002, Amended February 2003, July 2004, July 2005, December 2007, September 2008, November 2009, May 2012, August 2018. Technical Requirements for Site Remediation (N.J.A.C. 7:26E). Trenton, New Jersey.
- NJDEP. August 2005, Updated April 2011. Field Sampling Procedures Manual (FSMP). Division of Hazardous Site Mitigation. Trenton, New Jersey.
- NJDEP. April 2014a. Site Remediation Program. Quality Assurance Project Plan Technical Guidance.
- NJDEP. April 2014b. Site Remediation Program. Analytical Laboratory Data Generation, Assessment and Usability Technical Guidance.
- NJDEP. April 2014c. Site Remediation Program. Data of Known Quality Protocols Technical Guidance.
- NJDEP. April 2014d. Site Remediation Program. Data Quality Assessment and Data Usability Evaluation Technical Guidance.

This AQAPP reflects the NJDEP April 2014 Quality Assurance Project Plan Technical Guidance and applies the option of submitting data collected for this investigation for data validation. QA/QC procedures described in this AQAPP are in accordance with applicable professional technical standards, NJDEP requirements, government regulations and guidelines, and specific project goals and requirements.

In accordance with Section 2.2 of the August 2018 N.J.A.C. 7:26E, the following topics are addressed in this document:

- Facility background and project scope
- Data quality objectives
- Project organization and responsibilities

- Sampling design and methodologies
- Field instrumentation
- Chain-of-custody, field storage, documentation, sample transportation and sample handling procedures
- Analytical methods, target analytes and regulatory criteria
- Data quality indicator performance criteria and quality control requirements
- Data deliverables
- Data review
- Data validation and usability
- Data assessment procedures

2. FACILITY BACKGROUND, FACILITY LOCATION AND PROJECT SCOPE

This section describes the general Facility background, Facility location and general scope of work for the activities to be performed at the Facility.

2.1 Facility background

The Facility began dynamite manufacturing operations in the 1870's and was operated by various companies until 1912 when Hercules was formed and became the sole owner. The Facility underwent a major expansion at this time in order to manufacture large volumes of various explosives and propellants in response to the demand for these products created by World War I. Since that time, a variety of explosives and specialty products have been produced at the Facility for military and commercial applications. In early 1995, Hercules sold the smokeless gunpowder business to Alliant Techsystems (Alliant), who operated the facility until December 31, 1996. Hercules re-acquired control of the facility on January 1, 1997 and as the property owner is responsible for the remediation and closure of the facility for sale or reuse. After operations ceased at the Facility in 1996, Hercules decontaminated and demolished the E&E manufacturing facilities.

The Facility consists of 13 former operational areas. During the previous RI, the Facility was segregated into the following specified areas for ease of discussion:

- Area I – Encompasses areas north and east of Powder Mill Road including B-Line, Storage, Finishing, and eastern portions of the Development former operation areas.
- Area II – Encompasses areas south and west of Mule Barn Road including Nitroglycerin (NG), Pentaerythritol Tetranitrate (PETN), Trinitrotoluene (TNT), and the Dynamite former operational areas. In addition, the Miscellaneous/Offsite Area is included in Area II.
- Area III – Encompasses central portions of the Facility including A-Line, Maintenance, Ammonia-Nitrate (AN), Diazo, and the western portion of Development former operational areas.

2.2 Facility Location

The approximately 1,200-acre Facility is located on Howard Boulevard, about 0.5 miles northwest of the center of Kenvil, in Morris County, New Jersey. The Facility is approximately 13,000 feet long by 5,000 feet wide. Eight hundred of the 1,200 total acres were developed for former plant use and the remaining 400 acres are undeveloped areas between process units and around the perimeter of the Facility; these undeveloped areas acted as a buffer between the former active portions of the Facility and the surrounding community.

Regionally, the Facility is approximately 40 miles west of New York City and 30 miles east of the Delaware Water Gap. The Facility is bounded by the New Jersey Transit Railway to the north, by Berkshire Road to the southeast, by Route 46 to the south, and by Howard Boulevard to the southeast. The acreage north of Howard Boulevard and the railroad is mostly undeveloped. Residential and commercial properties predominate southeast of Berkshire Road and Route 46. Two small lakes are present immediately south of the Facility. The former production areas are centrally located within the Facility in a relatively flat area with a slight slope extending to Howard Boulevard on the northwest side and a topographic ridge on the southeast side that separates the production area from the Berkshire Valley area. The undeveloped areas are covered with mature

trees, and the former operation areas are covered with grass, weeds or young trees. The property contains several wet areas and has one major pond, known as "Duck Pond", which is approximately 9 acres in size.

Currently, all buildings and structures at the Facility have been demolished to grade except for several one-story structures in Area III, the wastewater treatment plant, a guard shack at the northern gate, and a guard shack and a small office building at the southern gate. These one-story structures have been used to store vehicles and maintenance equipment. The wastewater treatment plant is currently inactive.

2.3 Project objective and scope

The PDI activities will include the collection and analysis of groundwater, surface water, soil, sediment, concrete and biological tissue samples from the Facility.

The objectives of these activities is to collect additional data to:

- Further refine the extent of COCs in groundwater, surface water, soil and sediment
- Develop site specific impact to ground water soil remediation standards (SRS)
- To evaluate the concentrations of COCs in groundwater over time
- Screen for the presence of COCs in biological tissue from small mammals
- Screen for the presence of COCs in concrete
- Evaluate the effectiveness of remedial activities
- Evaluate and design remedial actions; and
- To support human health and ecological risk assessment activities

The PDI will be conducted in accordance with the following guidance:

- NJDEP. Readoption December 2002, Amended February 2003, July 2004, July 2005, December 2007, September 2008, November 2009, May 2012. *Technical Requirements for Site Remediation* (N.J.A.C. 7:26E). Trenton, New Jersey.
- NJDEP. August 2005, Updated April 2011. *Field Sampling Procedures Manual*. Division of Hazardous Site Mitigation. Trenton, New Jersey.
- NJDEP. 2015. *NJDEP Technical Guidance for the Site Investigation of Soil, Remedial Investigation of Soil, and Remedial Action Verification Sampling of Soil (*Soil SI/RI/RA Guidance) (Ver. 1.2).

2.4 Laboratory Analysis

The samples collected for this PDI will be submitted to the following laboratories for analysis:

- Pace Analytical Services, LLC of Madison, Wisconsin for explosives by USEPA Method 8095.
- Eurofins Frontier Global Sciences of Bothell, Washington for methyl mercury, dimethyl mercury, total mercury, inorganic mercury, free elemental mercury, mercury selective sequential extraction analysis and arsenic speciation (Subcontractor to Eurofins Lancaster Laboratories, Inc. of Lancaster, Pennsylvania).
- CT Laboratories of Barboo, Wisconsin for nitrocellulose analysis (Subcontractor to Eurofins Lancaster Laboratories, Inc. of Lancaster, Pennsylvania).

- EMSL Analytical, Inc. of Cinnaminson, New Jersey for asbestos (Subcontractor to Eurofins Lancaster Laboratories, Inc. of Lancaster, Pennsylvania).
- Eurofins Lancaster Laboratories, Inc. of Lancaster, Pennsylvania for the remaining analyses.

Samples collected for the methods listed in **Table 1** will be shipped from the field location to each laboratory for analysis.

Table 1 presents the analytical methods, sample collection containers and volumes, preservation, holding times and associated quality control sample frequency and NJDEP method certification status. For some methods, NJDEP certification is not offered.

The target analytes are listed in **Table 2-1A, Table 2-1AA, Table 2-1B, Table 2-1BB, Table 2-1C, Table 2-1CC, Table 2-2A, Table 2-2AA, Table 2-2B, Table 2-2BB, Table 2-2C, Table 2-2CC, Table 2-2D, Table 2-3E, Table 2-3A, Table 2-3AA, Table 2-3B, Table 2-3BB, Table 2-3C, Table 2-4A, Table 2-4B, Table 2-4CC, Table 2-5A, Table 2-5B, Table 2-6A, Table 2-6AA, Table 2-6B, Table 2-6BB, Table 2-6C, Table 2-6D and Table 2-6DD**.

The QC requirements and corrective actions listed in **Tables 3-1** through **3-19**, which supplement the method requirements, are to be followed by the laboratory.

The laboratory performing the analysis will be responsible for the quality control of the data reported for this project.

Laboratories reporting environmental results will evaluate non-detected aqueous, solid and biological tissue results to the method detection limits (MDLs) and report the non-detected results referencing the reporting limit (RL). The RL concentration is established by the lowest standard in the instrument calibration. For the remaining data, results that are less than the RLs but greater than or equal to the MDLs will be reported using the "J" flag. For example, for a target analyte with a RL of 10 ug/L and an MDL of 2 ug/L, a non-detected result is reported as 10 ug/L "U", indicating that a concentration greater than or equal to the MDL was not detected by the laboratory. A detected concentration of 6 ug/L is reported as 6 "J" and a detected concentration of 23 ug/L is reported without a laboratory flag. Each laboratory must include both RLs and MDLs on the sample result sheet that is reported to the data user.

Where applicable, the RLs and MDLs listed in **Table 2-1A, Table 2-1AA, Table 2-1B, Table 2-1BB, Table 2-1C, Table 2-1CC, Table 2-2A, Table 2-2AA, Table 2-2B, Table 2-2BB, Table 2-2C, Table 2-2CC, Table 2-2D, Table 2-3E, Table 2-3A, Table 2-3AA, Table 2-3B, Table 2-3BB, Table 2-3C, Table 2-4A, Table 2-4B, Table 2-4CC, Table 2-5A, Table 2-5B, Table 2-6A, Table 2-6AA, Table 2-6B, Table 2-6BB, Table 2-6C, Table 2-6D and Table 2-6DD** or the most recent MDLs and RLs, will be reported by the laboratory.

The laboratory will provide sample containers for the investigation, prepared in accordance with method and SOP requirements and this AQAPP.

Communications with RAMBOLL will be documented by the laboratory in the data packages. The analytical data will be reported in NJDEP full deliverable format in both hardcopy and electronic data format.

2.5 Data Validation

At the discretion of the RAMBOLL or KJ Project Manager and Project LSRP following receipt of final laboratory data packages, a data usability evaluation or full and/or partial data validation will be performed in accordance with this AQAPP.

Data validators from RAMBOLL or KJ and will provide data evaluation services.
Data Usability Evaluation and Data Validation will be performed applying one of the following approaches:

- At a minimum, Data Usability Evaluation will be performed for all samples collected for the investigation
- If deemed appropriate by the LSRP and RAMBOLL or KJ Project Manager, or required by NJDEP regulations, full data validation will be performed for 10 percent of the samples collected for the investigation and partial validation will be performed for the remaining samples.

Upon request by the data validator, the laboratory will provide additional or supplemental information within 3 working days of the request.

Data will be evaluated using the QA/QC criteria established in the methods utilized by the laboratory for analysis, the quality control requirements and corrective actions listed in **Tables 3-1 to 3-19**, and laboratory established criteria, where applicable.

A more detailed description of the Data Usability Evaluation and Data Validation procedures is provided in section 14.5

2.6 Documentation

Laboratory analytical data will be provided in both hardcopy and electronic data deliverable (EDD) format in accordance with the laboratory's internal protocol for NJDEP deliverable requirements for electronic data in New Jersey HAZSITE format.

The findings of this investigation will be documented in a PDI Report.

Records will be incorporated into the final project files for the samples. PDF data packages, EDDs, and final reports uploaded to Ashland's ENFOS system for project archive.

3. DATA QUALITY OBJECTIVES, DATA QUALITY INDICATORS AND CONCEPTUAL SITE MODEL

The Data Quality Objective (DQO) Process, as it has been applied to this PDI, comprises the following steps, consistent with guidance presented in the United States Environmental Protection Agency (USEPA) Guidance for the Data Quality Objectives Process (EPA QA/G-4), February 2006. The DQO process establishes the acceptance criteria, which serve as the basis for collecting data of sufficient quality and quantity to support the goals of the project activities.

3.1 DQO Process

The process consists of the following seven iterative steps for the DQO process:

1. **Step 1** - State the Problem – Additional data is required to evaluate the extent of COCs in groundwater, surface water, soil, sediment, concrete demolition debris and small mammal biological tissue. Planned Facility activities include monitoring well installation, groundwater sampling, soil sampling, surface water sampling, sediment sampling, concrete sampling and biological tissue sampling and analysis.
2. **Step 2** - Identify the Goal of the Study – The purpose of the PDI activities is to provide additional data for the following objectives:

- Further refine the extent of COCs in groundwater, surface water, soil and sediment
- Develop site specific impact to ground water soil remediation standards (SRS)
- To evaluate the concentrations of COCs in groundwater over time
- Screen for the presence of COCs in biological organism tissue
- Screen for the presence of COCs in concrete
- Evaluate the effectiveness of remedial activities
- Evaluate and design remedial actions; and
- To support human health and ecological risk assessment activities

3. **Step 3** - Identify information inputs (the data types that will be required before project decisions can be made) - The primary required data types will be analytical results from groundwater, surface water, soil, sediment, concrete demolition debris and small mammal biological tissue samples collected from the Facility.
4. **Step 4** -Define the Boundaries of the Study (the spatial and temporal features pertinent for decision making) – The Facility is located at the Former Kenvil Works in Kenvil, New Jersey. The approximately 1,200-acre Facility is located on Howard Boulevard, about 0.5 miles northwest of the center of Kenvil, in Morris County, New Jersey. The Facility is approximately 13,000 feet long by 5,000 feet wide. Eight hundred of the 1,200 total acres were developed for former plant use and the remaining 400 acres are undeveloped areas between process units and around the perimeter of the Facility; these undeveloped areas acted as a buffer between the former active portions of the Facility and the surrounding community. Sampling will be completed at on-site and off-site locations.
5. **Step 5** - Develop the analytic approach (how will the study results be analyzed and conclusions made from the data) - The analytical results will be compared to the NJDEP Class IIA Groundwater Quality Standards: Higher of PQL and GWQC, NJDEP Soil Residential and Non-Residential Remediation Standards, Default Impact to Groundwater Soil Screening Levels and NJDEP Ecological Screening Criteria. The analytical results, including contaminants detected in the samples exceeding the aforementioned standards will be

reported to the NJDEP. Based on the results of the investigation, it may be necessary to conduct additional RI activities to fill the data gaps that remain to fully characterize the Facility.

6. **Step 6** - Specify performance or acceptance criteria (performance or acceptance criteria that the collected data will need to achieve) – Data must be of known quality to withstand scientific and legal challenges relative to its intended purpose. Completeness is the measure of the amount of valid data obtained from a measurement system compared to the amount expected to be obtained under normal conditions. Based on evaluation of the data in terms of precision, accuracy, representativeness, comparability, and sensitivity, a completeness objective of 95 percent of the data set has been established for the proposed sampling activities. If the completeness objective is not met, additional sampling may be warranted.
7. **Step 7** - Develop the plan for obtaining data- The samples will be collected and analyzed as described in this AQAPP.

To meet the DQOs for this investigation, the results will be compared to the following regulatory criteria:

For groundwater and surface water samples:

- NJDEP Class IIA Groundwater Quality Standards: Higher of PQL and GWQC, current as of January 2018.
- NJDEP Ecological Screening Criteria, current as of January 2018.

For soil, sediment, concrete demolition debris and biological tissue samples (where applicable):

- NJDEP Soil Residential and Non-Residential, current as of January 2018.
- Default Impact to Groundwater Soil Screening Levels, current as of January 2018.
- NJDEP Ecological Screening Criteria, current as of January 2018.

3.2 Data Quality Indicators

Data quality indicators (DQIs), measurement performance criteria (MPC), and QC sample and/or activity are used to assess the measurement performance for both the sampling and analytical measurement systems. DQIs include the PARCCS (precision, accuracy, representativeness, comparability, completeness and sensitivity) parameters; a method of assessing the validity of environmental data. Precision, accuracy, and completeness can be measured quantitatively based on techniques described below. Representativeness and comparability are qualitative measurements.

The definitions for the assessment of data quality are discussed in the following section. The equations used for the assessment of data quality are discussed in Section 11.4.

Precision is a measure of the variation among individual measurements of the same sample i.e., the relative percent difference (RPD) of the results obtained for a sample and a split/blind duplicate sample collected at the same time and in the same way as the original sample. The precision of the methods will be determined by the analysis of laboratory duplicate, MS/MSD and field duplicate samples. The precision will be evaluated by calculating the RPD between the duplicates. RPD calculations will be compared to the established limits. The laboratory control limits will be used to evaluate field precision for this investigation.

Accuracy is a measure of the distortion of a measurement from its true value i.e., the percent recovery of a sample spiked with a known concentration of the analytes being tested for. Accuracy/bias may be assessed utilizing control charts in the laboratory. Control charts will consist of line graphs that provide a continuous graphic representation of the state of each analytical procedure. The standard deviation of the mean of the QC measurement is calculated and the upper and lower warning limits are set at plus or minus two standard deviation units. The upper and lower control limits are set at plus or minus three standard deviation units. Acceptable data are realized when results fall between the lower and upper warning limits. If the QC value falls between the control limit and the warning limit, the analysis should be scrutinized as possibly out of control. The laboratory control limits will be used to evaluate accuracy for this investigation. Accuracy will be determined by evaluation of MS recoveries, LCS recoveries, internal standard recoveries, calibration, instrument performance checks and target analyte identification and quantitation.

In general, the accuracy of the methods will be determined by spiking the sample matrix with the analyte and by analyzing reference materials with known concentrations. The spiking levels will be selected to reflect the concentration range of interest. Percent recoveries of the spikes and reference materials will be calculated and compared to the established limits.

Representativeness is a measure of how closely the results received reflect the actual concentrations or distribution of compounds in a sample, as well as field conditions and environmental conditions. Sampling plan design, sample collection techniques, and sample handling protocols have been developed to ensure the collection of representative samples. Field and laboratory blanks will be analyzed to assess sample contamination. The investigation has been designed so that the samples collected are as representative as possible of the medium being sampled and that a sufficient number of samples will be collected.

Comparability expresses the confidence with which one data set can be compared to another. To ensure comparability, standard sample collection and sample analysis procedures, second source reference standards, reporting units, and standardized data reporting format will be utilized. Completeness is a measure of the number of samples collected versus the number of samples analyzed. Data completeness determines whether planned DQOs have been satisfied and is based upon the usability calculation.

For this project, the analytical data completeness objective is 95 percent.

Sensitivity is a measure of sensitivity is made by a comparison of laboratory RLs to the requirements for the DQOs and through evaluation of blank analyses and holding time results. This comparison of RLs will be performed prior to sample analysis, with expected laboratory RLs, and following sample analysis, with actual RLs.

3.3 Historical Data

Historical data will be combined with current data to address the primary objectives for the PDI.

3.4 Conceptual Site Model

A Conceptual Site Model (CSM) for the Facility is presented in the *Phase II Remedial Investigation Report – Summary (Volume A*) that was submitted to the NJDEP in May of 2016.

4. PROJECT ORGANIZATION AND RESPONSIBILITY

RAMBOLL and KJ will be responsible for project management, sample collection, data valitation and data reporting. RAMBOLL will be responsible for AQAPP generation.
The following laboratories will perform sample analyses:

- Eurofins Lancaster Laboratories, Inc. of Lancaster, Pennsylvania for the remaining analyses.
- Pace Analytical Services, LLC of Madison, Wisconsin for explosives by USEPA Method 8095.
- Eurofins Frontier Global Sciences of Bothell, Washington for methyl mercury, dimethyl mercury, total mercury, inorganic mercury, free elemental mercury, mercury selective sequential extraction analysis and arsenic speciation.
- CT Laboratories of Barboo, Wisconsin for nitrocellulose analysis.
- EMSL Analytical, Inc. of Cinnaminson, New Jersey for asbestos.

Responsibilities for key project team members are summarized below.

4.1 Regulatory Agency and Client Key Personnel

Mark Foley of WSP Environment & EnergyUSA is the LSRP for the PDI and has oversight authority on behalf of Hercules for corresponding with NJDEP.

Mark Foley –LSRP
Senior Project Director
WSP USA
200 Cottontail Lane, Suite A112W
Somerset, NJ 08873
mark.foley@wspgroup.com
(732) 564-0888 X16

4.2 Hercules Representative

Edward Meeks is the primary contact at Hercules and is responsible for the execution of each phase of the project, including any correspondence and coordinating activities with NJDEP.

Edward Meeks – Hercules Project Manager
Hercules
500 Hercules Road
Wilmington, DE 19808-1599
edmeeks@ashland.com
(302) 995-3433

4.3 RAMBOLL Key Personnel

4.3.1 RAMBOLL Project Officer

Imants Reks, P.G. is the RAMBOLL Project Officer and has overall responsibility for meeting the stated project objectives. In addition, he is responsible for providing the RAMBOLL Project Manager with access to RAMBOLL corporate resources.
Imants Reks, P.G. – RAMBOLL Project Officer

RAMBOLL
333 W Washington St
Syracuse, NY 13202
Imants.Reks@ramboll.com
(315)956-6452

4.3.2 RAMBOLL Project Manager

John Lucey, P.G. is the RAMBOLL Project Manager and is responsible for implementing the PDI tasks to be completed by RAMBOLL and in managing the technical work, resources and costs to meet project objectives and requirements. His primary function is to meet the technical, financial, and scheduling objectives of the project and provide direction to RAMBOLL Project Team.

John Lucey –RAMBOLL Project Manager
John.Lucey@ramboll.com
(302) 562-2505

4.3.3 Kennedy Jenks Project Manager

Scott Larew is the KJ Project Manager and is responsible for implementing the PDI tasks to be completed by Kennedy Jenks and in managing the technical work, resources and costs to meet project objectives and requirements. His primary function is to meet the technical, financial, and scheduling objectives of the project and provide direction to the Kennedy Jenks Project Team.

Scott M. Larew – KJ Project Manager
214 Carnegie Center, Suite 103
Princeton, New Jersey 08540
ScottLarew@kennedyjenks.com
(609)285-2626

4.3.4 RAMBOLL QA Officer

Karen Storne is the RAMBOLL QA Officer (QAO) for this project. She will manage and be responsible for AQAPP generation and revisions and QA/QC review of data generated by RAMBOLL during the sample collection activities. Data processing and evaluation will be overseen and reviewed by the RAMBOLL QAO. If QA problems or deficiencies requiring special action are identified, the RAMBOLL QAO, Project Manager, and Project Officer will determine the appropriate corrective action. The QAO will then be responsible for follow-up and oversight of corrective action implementation, to the satisfaction of Hercules and the NJDEP representative. The RAMBOLL QAO may perform data validation activities for data generated by RAMBOLL or designate additional data validators to work under her direction. Data validators will be responsible for review of laboratory data for compliance with the project-specific DQOs and for such parameters as precision, accuracy, representativeness, comparability, sensitivity and completeness. Data validators will notify the QAO of any major QA deficiencies.

Karen Storne–RAMBOLL QA Officer
Karen.Storne@ramboll.com
(315) 662-3458

Janice Sloan – KJ QA Officer and Project Database Custodian

Janice Sloan is the QAO for KJ and QAO may perform data validation activities for data generated by KJ or designate additional data validators to work under her direction. Data validators will be responsible for review of laboratory data for compliance with the project-specific DQOs and for such parameters as precision, accuracy, representativeness, comparability, sensitivity and completeness. Data validators will notify the QAO of any major QA deficiencies.…

Janicesloan@kennedyjenks.com
(253) 835-6404

Janice is supported by Valerie Kull on the database management side. Valerie has been involved in the development and management of the project data across multiple database platforms over the past 10 years. The data is currently managed in EQuIS.
valeriekull@kenedyjenks.com
(609) 955-4536

4.3.5 RAMBOLL and KJ Field Investigation Managers

The RAMBOLL and KJ Field Investigation Manager will be responsible for directing and coordinating the day-to-day activities while field activities are underway.

4.3.6 Field Sampling Personnel

RAMBOLL and KJ field sampling personnel will be responsible for collection, packaging, preservation, and shipping of environmental samples in accordance with the AQAPP and applicable NJDEP requirements. Field sampling personnel will also collect field data and monitor site health and safety.

4.3.7 Health and Safety Coordinator

The RAMBOLL and KJ Health & Safety Coordinators and will be responsible for monitoring site health and safety during the sampling events.

- Ramboll

  Karin Goldenbaum
  110 Fieldcrest Avenue
  Raritan Plaza l - 2nd Floor
  Edison, New Jersey 08837 (609) 651-0152
  Karin.Goldenbaum@ramboll.com

- KJ

  Laura Sterner
  214 Carnegie Center
  Princeton, NJ 08540
  (609) 285-2626
  LoraSterner@kennedyjenks.com

4.4 Laboratory Management

The samples collected for this PDI will be submitted to the following laboratories:

- Eurofins Lancaster Laboratories LLC (Lancaster) of Lancaster, Pennsylvania

  Eurofins Lancaster Laboratories Inc.
  2425 New Holland Pike
  Lancaster, Pennsylvania 17601
  (724)720-9386
  NJDEP NELAC Certification Number: PA011

- Pace Analytical Services, LLC (Pace) of Madison, Wisconsin for explosives by Method 8095

  Pace Analytical Services, LLC
  2825 Advance Rd
  Madison, Wisconsin 53718
  (704)796-4830
  LELAP/NELAP Certification Number: 152019/ACC20170003/04165

- Pace Analytical National Center for Testing & Innovation

  Pace Analytical National Center for Testing & Innovation
  12065 Lebanon Road
  Mt. Juliet, TN 37122
  NELAC Certification Number: TN002/180006
  Alana Harvill- Pace National- aharvill@pacenational.com – (615-) 773-9787

- Eurofins Frontier Global Sciences (EFGS) of Bothell, Washington for methyl mercury, dimethyl mercury, total mercury, inorganic mercury, elemental mercury, mercury selective sequential extractions and arsenic speciation.

  Eurofins Frontier Global Sciences
  11720 North Creek Parkway N, Suite 400
  Bothell, Washington 98011
  (425)686-3584
  NJDEP NELAC Certification Number: WA014

- CT Laboratories (CT) of Barboo, Wisconsin for nitrocellulose.

  CT Laboratories
  1230 Lange Court
  Baraboo, Wisconsin 53913
  (608)356-2760
  LELAP Certification Number: 115843/ACC20170002

- EMSL Analytical of Cinnaminson (EMSL), New Jersey for asbestos.

  EMSL Analytical Inc.
  200 Route 130 North
  Cinnaminson, New Jersey 08077
  (800)220-3675

NJDEP NELAC Certification Number: 03036

- Ramboll of East Norriton, Pennsylvania, Groundwater/Surface Water Field Parameters.

  EMSL Analytical Inc.
  301 E Germantown Pike,
  East Norriton, PA
  (484) 804-7200
  NJDEP Certification Number: PA024

- KJ of Princeton, New Jersey, Groundwater/Surface Water Field Parameters.

  214 Carnegie Center
  Princeton, NJ 08540
  (609) 285-2626
  NJDEP Certification Number: 11048

Copies of the laboratory certifications are provided in **Appendix A**. Laboratory SOPs and Laboratory Quality Assurance Manuals (QAM) are available upon request.

4.4.1 Laboratory Project Manager

Lynn Frederiksen is the Laboratory Project Manager for Lancaster, Patrick Garcia-Strickland is the Laboratory Project Manager for EFGS, Ceress Berwanger is the Project Manager for CT, Gary Perimutter is the Project Manager for EMSL and Jessica Esser is the Project Manager for Pace. The Project Managers will be responsible for:

- Coordinating laboratory analysis.
- Supervising in-house chain-of-custody.
- Scheduling sample analysis.
- Overseeing data review.
- Overseeing preparation of analytical reports.

It will be the responsibility of the Laboratory Project Manager to approve final analytical reports prior to submission to RAMBOLL or KJ.

5. SPECIAL TRAINING REQUIREMENTS

Field investigation personnel must comply with the training requirements for hazardous waste operations, codified in 29 CFR 1910.120(e). Each individual must have successfully completed a 40-hour (or 24-hour) course appropriate to the level of work that is performed. In addition, each individual must have completed an 8-hour refresher course within the last 12 months if the initial training was more than 12 months ago. Personnel acting in the capacity of an on-site supervisor, directly responsible for supervising employees engaged in hazardous waste operations, shall also have successfully completed an 8-hour Supervisor training course. Field personnel must have documentation (copies of certificates, or I.D. cards) available at the Facility as proof of compliance with the training requirements.

6. INVESTIGATION PROCESS/SAMPLING DESIGN AND METHODOLOGIES

PDI samples will be collected in accordance with the following guidance:

- NJDEP. Readoption December 2002, Amended February 2003, July 2004, July 2005, December 2007, September 2008, November 2009, May 2012. Technical Requirements for Site Remediation (N.J.A.C. 7:26E). Trenton, New Jersey.
- NJDEP. August 2005, Updated April 2011. Field Sampling Procedures Manual. Division of Hazardous Site Mitigation. Trenton, New Jersey.
- NJDEP. 2015. NJDEP Technical Guidance for the Site Investigation of Soil, Remedial Investigation of Soil, and Remedial Action Verification Sampling of Soil (Soil SI/RI/RA Guidance) (Ver. 1.2).

6.1 Sampling and analysis activities

Project sampling and analysis activities will be determined on an as needed basis to address the project needs and objectives. Project Work Plans will be developed to reflect the requirements and methods listed in this AQAPP as activities are identified.

6.2 Standard Operating Procedures

Standard operating procedures (SOPs) for field operations are provided the following documents:

- The February 2006 Final Field Quality Assurance Project Plan prepared by MWH
- October 2013 Work Plan Memorandum prepared by RAMBOLL

The documents are provided in **Appendix B**. Additional SOPs may be developed to support PDI activities. These SOPs will be included in task specific work plans

7. FIELD INSTRUMENTATION AND INSPECTION OF SUPPLIES

The following field equipment is expected to be used:

- Photoionization detector (PID) – used for the installation of the monitoring wells and soil sampling activities
- Submersible pump –acceptable pumps include centrifugal or bladder pumps constructed of stainless steel or Teflon®. A peristaltic pump may not be used for low flow sampling activities
- Electronic Water Level Indicator
- The following Water Quality Analyzers will be used for the measurement pH, temperature, specific conductivity, dissolved oxygen (DO), oxidation-reduction potential (ORP) and turbidity in surface water and groundwater:
  - Horriba U-52
  - Horriba U-54
  - YSI 6920
  - YSI 6820
- Expray Soil Screening Kit for explosive target analytes

SOPs for the operation of these instruments is provided in Appendix B.

7.1 Field Equipment Calibration

Field instruments will be calibrated in such a manner that accuracy and reproducibility of results are consistent with the manufacturer's specifications. Equipment to be used for the field sampling will be examined to confirm that it is in good operating condition. This includes checking the manufacturer's operating manual and the instructions for each instrument to confirm that the maintenance requirements are being observed.

In general, instruments will be calibrated daily prior to use and will be recalibrated as required. All calibration procedures performed will be documented in the field logbook. Calibration checks will be performed at the intervals specified by the manufacturer. In the event that an internally calibrated field instrument fails to meet calibration procedures, it will be returned to the manufacturer for service.

7.2 Field Equipment Preventative Maintenance

Preventative maintenance procedures will be carried out on field equipment by RAMBOLL or KJ personnel in accordance with the procedures outlined in the manufacturers' specifications and/or equipment manuals.

Maintenance activities involving field equipment will be recorded in the field logbook. Field equipment will be check by qualified field representatives prior to being used in the field. Problems encountered while operating the instrument will be documented in the field logbook. If problem equipment is detected or should require service, the equipment will be returned and a qualified technician will perform the maintenance required. Use of the instrument will not be resumed until the problem is resolved.

7.3 Inspection Requirements for Supplies

The use of standard materials of a known purity and quality is necessary for the generation of reproducible data. The laboratory will monitor the use of laboratory consumable materials including solutions, standards, and reagents as described in this AQAPP.
Solvent materials are also verified prior to use. Each new lot of solvent is analyzed to verify the absence of interfering constituents. Reagent and method blanks are routinely analyzed to evaluate possible laboratory-based contamination of samples.

The sample containers used for this project will be supplied by the laboratory. The containers will be pre-cleaned sample containers that will be purchased from a USEPA-certified manufacturer (I-Chem 200 or equivalent container) or are cleaned using USEPA protocols.

The Laboratory Project Manager and the field representatives will be ultimately responsible for checking supplies for contamination.

Chemical reagents and solvents used by the field personnel will be provided by the laboratory.

8. CHAIN-OF-CUSTODY, FIELD STORAGE, DOCUMENTATION, SAMPLE TRANSPORTATION AND SAMPLING HANDLING PROCEDURES

8.1 Field and Laboratory Custody Procedures

Chain-of-custody procedures will be instituted and followed throughout the investigation. These procedures include field custody, laboratory custody, and evidence files. Samples are physical evidence and will be handled according to strict chain-of-custody protocols. The RAMBOLL of KJ Project Manager must be prepared to produce documentation that traces the samples from the field to the laboratory and through analysis. USEPA has defined custody of evidence as follows:

- In actual possession
- In view after being in physical possession
- In a locked laboratory
- In a secure, restricted area.

8.2 Sample Containers and Field Storage

Table 1 lists the proper sample containers, sample collection information and holding times. If field storage is required, the samples will be stored in a secured storage facility.

The laboratories will supply appropriate sample containers for samples in coolers as well as preservatives (as presented in **Table 1**). QA measures for these samples will begin with the sample containers; pre-cleaned containers will be purchased from a USEPA-certified manufacturer (I-Chem 200 or equivalent).

Immediately after collection, samples will be transferred to properly labeled sample containers, and properly preserved. **Table 1** lists the proper sample container, sample volumes, preservation, and holding times.

Samples requiring refrigeration for preservation will be promptly transferred to coolers packed with wet ice and/or ice packs. If field storage is required, the samples will be stored in a secured storage facility and a cooler temperature of less than or equal to 6 °C will be maintained.

8.3 Field Documentation

The field sampler is personally responsible for the care and custody of the sample until transferred.

The field logbook will be used to note information regarding collection of samples and any observations. All entries will be signed and dated. Field logbooks will be waterproof and bound. The logbook will be dedicated to the project and pages will not be removed. Corrections will be made by drawing a single line through the incorrect data and initialing and dating the correction that was made to the side of the error. An initialed diagonal line will be used to indicate the end of an entry or the end of the day's activities.

The following information will be recorded on the field logbook by the field sampling team:

- Name and title of author, date, and time of site entry, and physical/environmental conditions during the field activity;
- Meteorological data;
- Project number, client name, and Site name;
- Name and title of field crew members;
- Sample media;
- Sample collection method, including equipment utilized;
- Number and volume of samples collected;
- Description of sample locations;
- Date and start and end time of sample collection;
- Diagrams of sampling process;
- Sample and QA/QC identification numbers;
- Sample distribution;
- Field observations;
- Field measurements made and equipment used;
- Initial and final field vacuum readings;
- Calculations, results, and calibration data for field sampling and measurements;
- References for maps and photographs of the sample location; and
- Dates and method of sample shipments.

A completed sample identification label or tag that will be sequentially numbered will be attached to each investigative sample and the sample placed in a sample container. The identification on the label/tag must be sufficient to enable cross-reference with the logbook. The sample label/tag will be recorded using waterproof, non-erasable ink and will be attached to the sample container using adhesive. Permanent marker will not be used on sample tags.

The sample labels/tags will contain the following information:

- Sample location/number identification;
- Site/Project name;
- Date and time of sample collection;
- Designation of the sample as a grab or composite;
- Type of sample matrix;
- Name/initials of the sampler;
- Whether the sample is preserved or unpreserved;
- Space for laboratory sample number (only on the sample tag); and
- General types of analysis to be performed.

8.4 Field Custody Procedures and Documentation

For the environmental samples, chain-of-custody records will be kept starting at the time that sample containers are placed in the coolers for transportation to the laboratory. One completed chain-of-custody record must be kept with each sample cooler at all times.

Example chain-of-custody forms for the various laboratories are provided Figures 2-1 through 2-5.

The following measures will be taken when completing a chain-of-custody record:

- The chain-of-custody forms will be completed in waterproof, non-erasable ink.
- The chain-of-custody forms will be completed neatly using printed text. If a simple mistake is made, the error will be lined out with a single line and initialed and dated.
- Each separate sample entry will be sequentially numbered.
- The use of "ditto" or quotation marks to indicate repetitive information in columnar entries should be avoided. If numerous repetitive entries must be made in the same column, a continuous vertical arrow will be used between the first entry and the next different entry.
- When more than one chain-of-custody form is used for a single shipment, each form will be consecutively numbered using the "page ___ of ___" format.
- If necessary, additional instructions will be placed directly onto the chain-of-custody form.
- Acronyms used on a chain-of-custody form will be defined.

For environmental samples, the chain-of-custody form will contain the following information:

- Laboratory name and address;
- Project identification and number;
- Sample description/location;
- Date and time of sample collection;
- Type and matrix of sample;
- Number of sample containers;
- Analysis requested/comments;
- Sampler signature/date/time;
- Date and signature of the field representative;
- Date and signature of the laboratory representative;
- Carrier used to ship coolers; and
- Air bill number (if shipped by a commercial carrier).

In the case that high concentrations are suspected to be present in the samples, a note to that effect will be included on the chain-of-custody form.

In the field logbook, samplers will note the information previously presented.
Samples will be packed prior to shipment using the following procedures (where applicable):

- Select a sturdy cooler in good repair and clean. Secure and tape the drain plug with fiber or duct tape.

- Be sure the lids on all bottles are tight (will not leak) and baggies are sealed.
- Where applicable, add ice that has been placed in heavy-duty polyethylene bags and properly sealed on top of or between the samples. Pack samples securely to eliminate breakage during shipment with ice packs to maintain the inside temperature of less than or equal to 6 °C.
- Sampling containers will be packed with packing materials. When possible, sample container preparation and packing for shipment will be completed in a well-organized and clean area. Sample containers will be prepared for shipment by wiping containers clean of debris/water using paper towels. Paper towels will be disposed with the personal protective equipment (PPE).
- Place chain-of-custody record into a Ziploc plastic bag, tape the bag to the inner side of the cooler lid, and close the cooler and securely tape (preferably with fiber tape) the top of the cooler shut. Two custody seals will be affixed to the latch and lid of the cooler. The number of the security seal will be recorded on the chain-of-custody form. The custody seals will consist of adhesive-backed tape that easily rips if it is disturbed. The field sampler will initial and date the seal. The seals must be broken to open the cooler and will indicate tampering if the seal is broken before receipt at the laboratory.
- A label containing the name and address of the shipper will be placed on the outside of the container.

8.5 Sample Transportation

The field sampling team will either hand deliver or ship the cooler via an overnight delivery service or contact the laboratory to send a courier for pick up. Prior to shipment of sample coolers, the field sampling team will contact the laboratory to notify the laboratory of the shipment.

Samples will remain in the custody of the sampler until transfer of custody is completed. Transfer consists of:

- Delivery of samples to the Laboratory Sample Custodian; and/or
- Signature of the Laboratory Sample Custodian on the chain-of-custody form as receiving the samples and signature of sampler as relinquishing the samples.

The chain-of-custody document will be completed by the field sampler and provided for each sample cooler. When transferring the possession of samples, individuals relinquishing and receiving will sign, date, and note the time on the chain-of-custody. Custody of samples must be continuous between parties and time gaps must not be present. Each shipment of samples to the laboratory must have its own chain-of-custody record with the contents of the shipment, method of shipment, name of courier, and other pertinent information written on the record. The original record accompanies the shipment and the copies are kept with the field forms and distributed to the RAMBOLL or KJ Project Manager. A copy of the chain-of-custody will be faxed to the laboratory and to the Project Manager on the same day of sample shipment. Freight bills, postal service receipts, and bills of lading will be retained as permanent documentation.

If a carrier is used to take samples between the sampler and the laboratory, the air bill number must be written on the chain-of-custody.

Samples will be shipped or transported within 24 hours of being collected and will arrive at the laboratory no later than 72 hours after sample collection.

8.6 Laboratory Custody Procedures

Laboratory custody procedures continue when the samples are received by the laboratory. When the samples arrive at the laboratory, the Laboratory Sample Custodian will sign the courier's air bill or bill of lading (unless hand-delivered) and will note the cooler temperature on the chain-of-custody form, where applicable. If the cooler temperature is greater than 6 °C, the RAMBOLL or KJ Project Manager will be notified. If the samples were shipped, the courier's air bill number will be attached to the chain-of-custody and the air bill number will be written on the chain-of-custody form. If the cooler arrives at the laboratory after hours, an external chain-of-custody will be properly filled out and will accompany the cooler until the laboratory receives the cooler. The Laboratory Sample Custodian's duties and responsibilities upon sample receipt will be to:

- Document receipt of samples by signing the record with the date and time of sample receipt.
- Note the cooler temperature on the chain-of-custody form where applicable.
- Inspect sample shipping cooler for the presence or absence of custody seals (only if shipped via overnight courier) and for container integrity.
- Sign the appropriate forms or documents, verify, and record the agreement or disagreement of information on sample documents and, if there are discrepancies, record the problem and notify the RAMBOLL or KJ Project Manager.
- Assign a number for each sample upon receipt. That sample number will be placed on the sample label which will remain attached to the sample container.
- Log sample information into the laboratory sample tracking system.
- Label sample with a unique, sequential laboratory sample number.
- Place samples in the walk-in cooler or sample storage area that is a secure, limited-access storage.

If QC samples have not been properly identified during sample collection, the Laboratory Project Manager will contact the RAMBOLL or KJ Project Manager to assign QC samples prior to the start of sample analysis.

The laboratory will immediately contact the RAMBOLL or KJ Project Manager if issues pertaining to sample condition or documentation are detected (e.g., broken security seal; compromised sample containers; chain-of-custody information in disagreement with sample labels).

8.7 Final Evidence Files

The final evidence file will be the central repository for documents that constitute evidence relevant to sampling and analysis activities as described in this AQAPP. RAMBOLL and KJ will be custodians of their respective evidence files and maintains the contents of evidence files for the Site, including relevant records, reported, logs, field notebooks, pictures, subcontractor reports, and data reviews.

Copies of the laboratory data packages will be stored by the laboratory for incorporation into the sample file. The Laboratory Project Manager will be responsible for laboratory data packages. Upon completion of the analyses, the RAMBOLL or KJ Project Manager will begin assimilating the field and laboratory data. In this way, the file for the samples will be generated. The final file for the sample will be stored by either RAMBOLL or KJ their respective facilities and will consist of the following:

- Laboratory data packages, including summary and raw data from the analysis of environmental and QC samples, chromatograms, mass spectra, calibration data, work sheets, and sample preparation log
- Chain-of-custody records
- Data validation reports
- Field notebooks and data
- Field collection report
- Pictures and drawings, if applicable
- Progress and QA reports
- Contractor and subcontractor reports
- Correspondence

The evidence file must be maintained in a secured, limited access area until submittals for the project have been reviewed and approved, and for a minimum of 10 years past the submittal date of the final report.

9. LABORATORY SAMPLE STORAGE AND HANDLING

At the laboratory, the analysts will be required to log samples and extracts in and out of storage as the analysis proceeds.

There must not be a lapse in the custody for the sample containers and exchanges of custody must be documented on the form. Samples will be returned to secure storage at the close of business. Care must be exercised to properly complete, date, and sign records needed to generate the data package.

Procedures to be followed by the laboratory include:

- Samples will be handled by the minimum number of people possible.
- The laboratory will set aside a secured sample storage area consisting of a clean, dry, refrigerated, isolated room.
- A specific person will be designated sample custodian. Incoming samples will be received by the custodian who will indicate receipt by signing the chain-of-custody form.
- The custodian will ensure that samples which are heat-sensitive, light-sensitive, radioactive, or which require special handling in other ways, are properly stored and maintained prior to analysis.
- The analytical area will be restricted to authorized personnel only.
- After sample analyses are complete, the analytical data will be kept secured and released to authorized personnel only.

10. ANALYTICAL METHODS, TARGET ANALYTES AND REGULATORY CRITERIA

The analytical methods, target analytes, detection limits and regulatory limits for the sampling activities are presented in **Table 2-1A, Table 2-1AA, Table 2-1B, Table 2-1BB, Table 2-1C, Table 2-1CC, Table 2-2A, Table 2-2AA, Table 2-2B, Table 2-2BB, Table 2-2C, Table 2-2CC, Table 2-2D, Table 2-3E, Table 2-3A, Table 2-3AA, Table 2-3B, Table 2-3BB, Table 2-3C, Table 2-4A, Table 2-4B, Table 2-4CC, Table 2-5A, Table 2-5B, Table 2-6A, Table 2-6AA, Table 2-6B, Table 2-6BB, Table 2-6C, Table 2-6D and Table 2-6DD**.

10.1 Analytical Methods and Laboratory Analysis

To obtain data of a quality sufficient to meet the project DQOs, the methods listed in Table 1 will be used for analysis of the environmental samples.

The laboratory will adhere to the specific analyses and QA/QC requirements in the analytical methods listed in **Table 1** and additional requirements listed in this AQAPP. The most recent laboratory control limits for accuracy and precision, will be used to evaluate the sample data. In addition, the QC requirements and corrective actions listed in **Tables 3-1 to 3-19**, which augment the method requirements, will be followed by the laboratory.

In the event of an analytical system failure, the Laboratory Project Manager will identify the situation and provide corrective action guidance. The RAMBOLL QAO and KJ Project Manager (if appropriate) will be notified and the situation will be documented in the data package case narrative.

Matrix interferences will be identified and documented during the analytical process. Samples may be diluted only if analytes of concern generate responses in excess of the linear range of the instrument. MDLs and RLs may only be achieved in an undiluted sample free of matrix interferences or of high concentrations of target analytes. If matrix interferences are encountered or if high concentrations of target compounds are present, established MDLs and RLs may not be achievable without impacting the instrument quality. If the laboratory has taken appropriate actions and matrix interferences prevent the laboratory from achieving the specified detection limits, the RAMBOLL QAO or KJ Project Manager (if appropriate) will be contacted as soon as the situation is identified. The Laboratory Project Manager will document, in the data package case narrative, how the laboratory demonstrated good analytical practices in order to attempt to achieve the specified reporting detection limits.

Blanks will not be subtracted from target analyte results.

The generated data will be input into the laboratory database management system. Laboratories analyzing samples for submittal to the NJDEP must meet the required NJDEP Environmental Laboratory Certification by holding NJDEP Environmental Laboratory Certification, NJDEP Primary NELAP Accreditation, NJDEP Secondary NELAP Accreditation or a combination of certifications and accreditation. Laboratories must meet and maintain the analytical protocol requirements stipulated in the New Jersey Regulations Governing the Certification of Laboratories and Environmental Measurements and the certified method.

Complete descriptions of analytical procedures to be used in the laboratory are described in the methods, the QC requirements and corrective actions listed in this AQAPP and the laboratory SOPs. The laboratory SOPs and QAM are available upon request.

10.2 Target Analytes and Detection Limits

The MDL is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix containing the analyte. The RL is the lowest concentration that can be reliably quantified within specified limits of precision and accuracy during routine laboratory operations.

The laboratories will evaluate non-detected results for solid, aqueous and biological results to the MDLs and report the non-detected results referencing the RL. The RL concentration is established by the lowest standard in the instrument calibration. Results that are less than the RLs but greater than or equal to the MDLs will be reported using the "J" flag. For example, for a target analyte with a RL of 10 ug/L and an MDL of 2 ug/L, a non-detected result is reported as 10 ug/L "U", indicating that a concentration greater than or equal to the MDL was not detected by the laboratory. A detected concentration of 6 ug/L is reported as 6 "J" and a detected concentration of 23 ug/L is reported without a laboratory flag. The laboratory must include both RLs and MDLs on the sample result sheet that is reported to the data user.

Where applicable, the RLs and MDLs listed in **Table 2-1A, Table 2-1AA, Table 2-1B, Table 2-1BB, Table 2-1C, Table 2-1CC, Table 2-2A, Table 2-2AA, Table 2-2B, Table 2-2BB, Table 2-2C, Table 2-2CC, Table 2-2D, Table 2-3E, Table 2-3A, Table 2-3AA, Table 2-3B, Table 2-3BB, Table 2-3C, Table 2-4A, Table 2-4B, Table 2-4CC, Table 2-5A, Table 2-5B, Table 2-6A, Table 2-6AA, Table 2-6B, Table 2-6BB, Table 2-6C, Table 2-6D and Table 2-6DD** or the most recent MDLs and RLs, will be reported by the laboratory.

Laboratories periodically update the MDL and RL values as part of internal laboratory policy.

10.3 Regulatory Criteria

Table 2-1A, Table 2-1AA, Table 2-1B, Table 2-1BB, Table 2-1C, Table 2-1CC, Table 2-2A, Table 2-2AA, Table 2-2B, Table 2-2BB, Table 2-2C, Table 2-2CC, Table 2-2D, Table 2-3E, Table 2-3A, Table 2-3AA, Table 2-3B, Table 2-3BB, Table 2-3C, Table 2-4A, Table 2-4B, Table 2-4CC, Table 2-5A, Table 2-5B, Table 2-6A, Table 2-6AA, Table 2-6B, Table 2-6BB, Table 2-6C, Table 2-6D and Table 2-6DD present the applicable NJDEP regulatory levels which will be used to evaluate analytical data for the sampling activities.

To meet the DQOs for this investigation, the results will be compared to the following regulatory criteria/guidance:

For groundwater and surface water samples:

- NJDEP Class IIA Groundwater Quality Standards: Higher of PQL and GWQC, current as of January 2018.
- NJDEP Ecological Screening Criteria, current as of January 2018.

For soil, sediment, concrete demolition debris and small mammal biological tissue samples (where applicable):

- NJDEP Soil Residential and Non-Residential, current as of January 2018.
- Default Impact to Groundwater Soil Screening Levels, current as of January 2018.
- NJDEP Ecological Screening Criteria, current as of January 2018.
- NJDEP Evaluation of Extractable of Extractable Petroleum Hydrocarbons in Soil Technical Guidance current as of June 2019
- Default Leachate Criteria for Class II Groundwater provided in the NJDEP's November 2013 Development of Site-Specific Impact to Ground Water Soil Remediation Standards using the Synthetic Precipitation Leachate Procedure.

11. QUALITY CONTROL REQUIREMENTS AND DATA QUALITY INDICATOR PERFORMANCE CRITERIA

The overall effectiveness of a QA/QC program depends on operating in the field and laboratory according to a program that systematically ensures the precision and accuracy of analyses by detecting errors and preventing their recurrence or measuring the degree of error inherent in the methods applied.

Quality Assurance is an integrated system of activities involving planning, quality assessment, reporting and quality improvement to ensure that a program meets defined standards of quality with a stated level of confidence. Quality Control involves the technical activities that measure the quality of a program so that it meets the needs of users.

A brief description of laboratory quality control (QC) analyses is presented in the following sections.

11.1 Laboratory QA/QC Checks

Tables 3-1 to 3-19 summarize the laboratory QC checks, frequency of analysis, control limits, and laboratory corrective actions for the analytical method to be used in this project. A brief description of laboratory QA/QC analyses is presented in the following subsections.

11.1.1 GC/MS Tuning

Tuning and performance criteria are established to verify mass resolution, identification, and to some degree, instrument sensitivity. These criteria are not sample specific; conformance is determined using standard materials. Therefore, these criteria should be met in all circumstances.

11.1.2 Calibration

Compliance requirements for satisfactory instrument calibration are established to verify that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of analysis, and continuing calibration and performance checks document satisfactory maintenance and adjustment of the instrument on a day-to-day basis.

11.1.3 Blanks

Several types of blanks will be analyzed by the laboratory. Corrective action procedures will be implemented for blank analyses if target compounds are detected at concentrations greater than the applicable criteria. The criteria for evaluation of blanks apply to any blank associated with a group of samples collected, prepared and/or analyzed at the same time, where applicable. If problems with a blank exist, data associated with the project must be carefully evaluated to determine whether or not there is an inherent variability in the data for the project, or if the problem is an isolated occurrence not affecting other data.

A method blank is an analyte-free blank that undergoes the preparation procedures applied to a sample. These samples are analyzed to examine whether sample preparation and analysis techniques result in sample contamination. The laboratory will prepare and analyze a method blank with each group of samples that are extracted, digested, or analyzed at the same time.

Field rinsate blanks are analyzed to assess contamination introduced during field sampling procedures and sample shipment, respectively. Field rinsate blank collection begins with two sets of identical bottles; one set filled with target analyte-free water provided by the laboratory, and one empty set of bottles identical to those provided for aqueous sample collection. At the field location, in an area suspected to be contaminated, the water is passed from the full set of bottles through the dedicated or field decontaminated sampling device(s) and into the empty set of bottles. This will constitute identical bottle to bottle transfer. The field rinsate blank samples will be subject to the same analyses as the environmental samples. One field rinsate blank will be collected during each day of the sampling event or one per 10 samples collected.

Trip blanks will be prepared as other samples submitted for VOC analysis and will contain analyte-free water or preservative, as appropriate. A trip blank will be prepared by the laboratory, using the same preservation technique as that used to prepare the sample containers, from the same source as the method blank water, and sent to the Site in the cooler with the other sample containers. The trip blank will undergo shipment from the sampling site to the laboratory in coolers with the environmental samples to be analyzed for VOCs. Trip blanks will be analyzed for VOCs to determine if contamination has taken place during sample handling and/or shipment. Trip blanks will be included in sample coolers at a frequency of one trip blank per cooler containing samples to be submitted for VOC analysis, consistent with Ramboll's internal policy.

11.1.4 Internal Standards Performance

Internal standards, which are compounds not found in environmental samples, will be spiked into samples, blanks, and laboratory control samples at the time of sample preparation for applicable methods. Internal standards should meet the criteria specified in the corrective action tables.

11.1.5 Surrogate Recovery

Accuracy and matrix biases for individual samples are monitored for organic analyses using surrogate additions. Surrogates are compounds similar in nature to the target analytes; the surrogates are spiked into aqueous and solid samples, blanks, and QC samples prior to sample preparation for organic analyses. The evaluation of the results of these surrogate spikes is not necessarily straightforward. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Since the effects of the sample matrix are frequently outside the control of the laboratory and may present relatively unique problems, the review and validation of data based on specific sample results is frequently subjective.

11.1.6 Laboratory Control/Laboratory Control Duplicate Samples

Laboratory control samples (LCSs) and laboratory control duplicate samples (LCSDs) are standard solutions that consist of known concentrations of the complete list of target analytes spiked into laboratory analyte-free matrix. They are prepared or purchased from a certified manufacturer from a source independent from the calibration standards to provide an independent verification of the calibration procedure. These QC samples are then prepared and analyzed following the same procedures employed for environmental sample analysis to assess method accuracy independently of sample matrix effects. Percentage recoveries are evaluated to assess the efficiency of the preparation and analysis method independent of environmental sample matrix effects. If performed by the laboratory, the LCSD is evaluated for laboratory precision.

11.1.7 MS/MSD Samples

MS/MSD data are generated to determine long-term precision and accuracy of the analytical method with respect to sample matrices. Generally, the MS/MSD data alone are not used to evaluate the precision and accuracy for associated organic samples since data may reflect specific matrix effects only present within one sample.

One set of MS/MSD samples will be collected for every 20 samples (minimum frequency of 5%) or one per matrix for less than 20 samples. If less than 20 samples are collected, one MS/MSD set will be collected. Whenever possible, MS/MSD samples will be prepared and analyzed within the same batch as the environmental samples. MS/MSD samples will be spiked at the laboratory with the complete list of target analytes.

11.1.8 Analyte Identification and Quantitation

The objective of the qualitative criteria is to minimize the number of erroneous identifications of compounds. An erroneous identification can either be a false positive (reporting a compound present when it is not) or a false negative (not reporting a compound that is present). The identification criteria can be applied much more easily in detecting false positives than false negatives. Negatives, or non-detect compounds on the other hand, represent an absence of data and are therefore much more difficult to assess. The objective for quantitative requirements is to maximize the accuracy of data and sensitivity of the instrument. Unless sample screening indicates the presence of high concentration target analytes, samples will be analyzed undiluted to maximize sensitivity. Samples must be reanalyzed at the appropriate dilution when concentrations exceed the linear calibration range to maximize accuracy. Matrix interferences will be identified and documented. Samples may be diluted only if analytes of concern generate responses in excess of the linear range of the instrument.

11.2 Field QA/QC Checks

In order to evaluate data quality, QA/QC samples will be collected during the sampling activities. Table 1 lists the environmental samples and corresponding QC samples to be collected by analysis.

11.2.1 Field Duplicate Samples

Collection of field duplicate samples provides for the evaluation of the laboratory's precision performance by comparing analytical results of two samples from the same location. They are also collected to evaluate field sample collection precision procedures. Samples are collected from one location and sent to the laboratory blind (with two different sample identifications). Duplicates of solid samples submitted for VOC analysis are obtained from discrete locations without mixing. Duplicates for the remaining analyses require homogenization by filling a decontaminated stainless steel tray or bowl with the sample and mixing it with a decontaminated stainless steel instrument. The mixed sample is divided in half and scooped alternatively from each half to fill the sample container. One field duplicate sample will be collected for every 20 samples (minimum frequency of 5%) or one per matrix for less than 20 samples. If less than 20 samples are collected, one field duplicate sample will be collected.

11.2.2 MS/MSDs

MS/MSD samples are duplicate samples that are collected in the field and have spiking solutions added at the laboratory during sample preparation. MS/MSD samples are considered identical to

the original sample. The percent recovery of the spiked amount indicates the accuracy of the extraction as well as interferences caused by the matrix. Relative percent differences (%RPD) between spike sample recoveries or between duplicate samples will indicate the precision of the data. One MS/MSD sample set will be collected for every 20 samples submitted to the laboratory (minimum frequency of 5%) or one MS/MSD for less than 20 samples.

11.2.3 Field Rinsate Blanks

One field rinsate blank, presented in Section 11.1.3, will be collected per 10 samples or once per day, whichever is more conservative.

11.2.4 Trip Blanks

Trip blanks, presented in Section 11.1.3, will be included in sample coolers at a frequency of either one trip blank per cooler, consistent with Ramboll's internal policy, or one trip blank per shipment of samples sent to the laboratory for VOCs.

11.2.5 Temperature Blanks

Temperature blanks will consist of vials of water that have undergone shipment from the sampling site to the laboratory in coolers with the environmental samples to be analyzed for the sampling program. The temperature of these blanks will be measured at the laboratory upon receipt of the sample cooler to verify compliance with the cooler temperature requirement.

11.3 Corrective Action

Generally, the following corrective actions may be taken by the laboratory. When analytical parameters that are within the control of the laboratory, including calibration, instrument performance, and blank criteria, are not met, the cause of the problem will be located and corrected. The analytical system will then be recalibrated. Sample analysis will not begin until calibration, instrument performance, and blank criteria are met. When matrix spike, standard, or duplicate analyses are out of control, samples analysis will cease. The problem will be investigated. Depending on the results of the overall QC program for the sample set, the data may be accepted, accepted with qualification, or determined to be unusable.

If, through the application of the corrective actions listed in this AQAPP, the data is determined to be unusable, the QC analysis will be re-prepared and reanalyzed. If QC criteria are met upon reanalysis, only the new results are reported. If QC criteria are still not met upon reanalysis, both sets of sample results will be reported and the RAMBOLL QAO or KJ Project Manager will be notified of the situation at the time of sample analysis.

If matrix interferences are suspected, the RAMBOLL QAO or KJ Project Manager will be contacted. Unless sample screening indicates the presence of high concentration target analytes, samples may be diluted in the analysis only if analytes of concern generate responses in excess of the linear range of the instrument.

If the laboratory has taken appropriate actions and matrix interferences prevent the laboratory from achieving the specified detection limits, the RAMBOLL QAO or KJ Project Manager will be contacted as soon as the situation is identified. The Laboratory Project Manager will document, in the data package case narrative, how the laboratory demonstrated good analytical practices in order to attempt to achieve the specified reporting detection limits.

11.4 Data Quality Indicator Performance Criteria

As presented in Section 3.2, data for accuracy/bias, precision, representativeness, sensitivity, comparability and completeness will be evaluated.

The definitions and equations used for the assessment of data quality are discussed below.

Accuracy /Bias - Is a measure of the nearness of an analytical result, or a set of results, to the true value. It is usually expressed in terms of error, bias, or percent recovery (%R).

Normally, the term accuracy is used synonymously with percent recovery. It describes either the recovery of a synthetic standard of known value, or the recovery of known amount of analyte (spike) added to a sample of known value. The %R or accuracy can be calculated by using:

Standards: %R = (observed value/true value) x 100

Spikes: %R = [((conc. spike + sample conc.) - sample conc.)x100)]/conc. Spike

Precision - Refers to the agreement or reproducibility of a set of replicate results among themselves without assumption of any prior information as to the true result. It is usually expressed in terms of the percent difference (%D) or RPD.

The %D is calculated by using:

%D = (larger SR - smaller SR x 100)/smaller SR

Where: SR is the sample result.

The RPD is calculated by using:

RPD = (OSR - DSRx 100)/((OSR + DSR)/2)

Where: OSR is the original sample result and DSR is the duplicate sample result.

Average - The average or arithmetic mean (X) of a set of n values (Xi) is calculated by summing the individual values and dividing by n:

$$X = (\sum Xi_{I=1\ to\ n}) \div n$$

Range - The range (Ri) is the difference between the highest and lowest value in a group. For n sets of duplicate values (X2, X1), the range (Ri) of the duplicates and the average range (R) of the n sets are calculated by the following:

Ri = X2 - X1

$$R = \sum Ri_{i=1\ to\ n} \div n$$

Standard deviation and variation - The standard deviation (S) of a sample of n results is the most widely used measure to describe the variability of a data set. It is calculated by using the following equation:

$$S = \sqrt{\frac{\Sigma (Xi - \overline{X})^2}{n-1}} \; n_{\text{ to } i-1}$$

Where: X is the average of the n results and Xi is the value of result. Normally, X ± S will include 68% and X ± 2S includes about 95% of normally distributed data.

The variance is equal to S2. The percent relative standard deviation (%RSD), or coefficient of variation (CV), is the standard deviation divided by the mean and multiplied by 100 as follows:

CV = 100S/X

The Laboratory Project Manager, with individual laboratory group leaders, will identify any data that should be rated as "unacceptable" based on the assessment of the QA/QC criteria.

Bias - Results of sample spiking are used to calculate the quality control parameter for accuracy evaluation, the percent recovery (%R).

%R = 100(S1 - S2)/T1
where: T1 = True concentration of the spike
S1 = Observed spiked sample concentration
S2 = Sample concentration without spike addition

Sensitivity - The measure of sensitivity is made by a comparison of laboratory RLs to the requirements for the DQOs. This comparison will be performed prior to sample analysis, with expected laboratory RLs, and following sample analysis, with actual RLs.

Completeness -Completeness is the fraction of usable data obtained from a measurement system (e.g., sampling and analysis) compared to that which was planned and is calculated as follows:
Completeness = (Usable Laboratory Measurements Made/ Laboratory Measurements Planned) / x 100%

12. DATA REVIEW

For data to be scientifically valid, legally defensible, and comparable procedures must be used to prepare and manage the data.

12.1 Data Reporting Procedures

Specific laboratory procedures and instrumentation can be found in the laboratory QAMs and SOPs. The data production and reporting procedures described below will be employed at the laboratory.

12.1.1 Data Reduction

Data reduction consists of manual and computer data reduction procedures and calculations. Computer data reduction procedures and calculations will be checked manually by the laboratory to verify that compound identification and quantitation adhere to method requirements. The laboratory will be responsible for maintaining a listing of computer-based data reduction programs and SOPs for data reduction. Sample preparation or extraction logs will be used to document sample preparation information (for example, preparation weights, volumes, reagents). Instrument injection logs or bench sheets will also be maintained for each instrument.

12.1.2 Laboratory Data Review

Analytical results are generally entered into the laboratory computer system by the analyst, independently reviewed by another analyst or supervisor experienced in the method, and approved by the Laboratory Manager. The following are requirements that are generally examined as part of this review:

- Initial calibration criteria were met. Standards in the calibration curve covered the expected concentration ranges of the samples including the RL.
- Initial and continuing calibrations met the acceptance criteria defined in the method standard procedure.
- Sample results fell within the range of the standard curve.
- Method blanks were processed with each analytical batch and no detectable levels of contamination were identified.
- MS/MSD and duplicate analyses were performed at the required frequency and results were within the control limits.
- LCS analyses were performed with each analytical batch and the results obtained were within control limits.
- Calculations have been accurately performed.
- Reporting units are correct.
- Data for the analysis provide a complete audit trail.
- Reported RLs comply with data quality indicator requirements.

The analyst's supervisor will check a minimum of 10% of the data back to raw data in the secondary review. When required analyses on the samples in a project are complete, entered, and reviewed, a report will be generated. The report will be forwarded to the assigned Laboratory Project Manager or designee for review. The report will then be reviewed for the following items (at a minimum):

- QC data will be reviewed to identify whether or not internal specification and contract requirements have been me.
- Non-conformance reports, if any, will be reviewed for completion of corrective actions and their impact of results. Non-compliance and corrective action procedures will be documented in the case narrative in the final report.

The report requires the signature of the Laboratory Project Manager or designee. Electronic data are copied onto computer tape, inventoried, and stored off-site in a secure facility, or within locked cabinets on-site. This data archive system is maintained for a minimum of ten years. Following final review, one hardcopy of the laboratory data package and a portable document format (PDF) copy will be transmitted to the RAMBOLL or KJ Project Manager.

13. DATA DELIVERABLES AND DATA MANAGEMENT

Definitive data will be generated in the laboratory. The laboratory-generated data will be entered into the laboratory DBMS and presented in data packages. The laboratory will perform the data review process, including a minimum of 10 percent check of the data back to raw data in the secondary review by a laboratory supervisor. Validation of the sample data will be performed as described in Section 14 of this AQAPP.

Laboratory analytical data will be provided in EDD format, in accordance with the laboratory's internal protocol for NJDEP deliverable requirements for electronic data in New Jersey HAZSITE format.

Data will be managed in a relational DBMS. Laboratory analytical data will be provided in electronic disk deliverable format for direct upload into the DBMS.

The laboratory is responsible for providing an EDD that matches the hardcopy and electronic data package for sample and analysis information. The EDD records must be the same format (i.e., flat file format). Field samples that are not collected from the project site should not be included in the laboratory report or EDD.

The DBMS will be used to provide custom queries and reports to support data validation, data analysis, and report preparation. Data validation qualifiers will be entered into the DBMS by hand. The DBMS will be checked independently to minimize data transmittal error and loss. Generally, the information flow will include the following steps:

- Samples will be collected in the field and transported to the laboratory.
- Samples will be analyzed at the laboratory and data generated.
- The laboratory data will be sent to the data validator for evaluation and to the Project Manager for preliminary evaluation.
- Qualified data will be sent to data management personnel and entered into the DBMS.
- The final data set from the DBMS will be provided to the Project Manager for data evaluation in terms of project goals.
- Project decisions based on results of the data analysis will be reported to Sunoco.

Records will be incorporated into the final project files for the samples. The field logs, data packages, and records will be included in the project files. The project files will be archived by RAMBOLL or KJ for a period of ten years.

14. DATA VALIDATION AND DATA USABILITY EVALUATION

At the discretion of the RAMBOLL or KJ Project Manager and Project LSRP following receipt of final laboratory data packages, a data usability evaluation or full and/or partial data validation will be performed in accordance with this AQAPP.

Data validators from RAMBOLL or KJ and will provide data evaluation services.

Data Usability Evaluation and Data Validation will be performed applying one of the following approaches:

- At a minimum, a Data Usability Evaluation will be performed for all samples collected for the investigation in accordance with the NJDEP's April 2014d. Site Remediation Program. Data Quality Assessment and Data Usability Evaluation Technical Guidance
- If deemed appropriate by the LSPR and RAMBOLL or KJ Project Manager, full data validation will be performed for 10 percent of the samples collected for the investigation and partial validation will be performed for the remaining samples.

Upon request by the data validator, the laboratory will provide additional or supplemental information within 3 working days of the request.

14.1 Data Usability Evaluation

The specific data quality requirements including precision, accuracy, representativeness, comparability, sensitivity, and completeness will, at a minimum, be assessed through a Data Usability Evaluation. Data usability with respect to the DQOs and data uses will be compared to the project requirements. In the event that the completeness objective of 95 percent is not achieved, samples may be recollected at the discretion of the Hercules LSRP, RAMBOLL or KJ Project Manager.

Based on the QA/QC information review and the qualifiers assigned to the analytical data, an overall evaluation of the data's usability will be performed. Data usability is defined as the percentage of data that remains unqualified or is qualified as approximate or non-detected due to blank contamination, divided by the data reported by the laboratory times 100. The percent usability excludes the data qualified as rejected due to major QA/QC excursions. The non-usable data is defined as the percentage of the data qualified as rejected divided by the data reported by the laboratory times 100. The data usability will be provided for each type of analysis performed.

The data usability evaluation considers the data parameters of precision, sensitivity, accuracy, representativeness, comparability, and completeness which are described as follows:

- Precision is evaluated through the review of field duplicate samples, laboratory duplicates, and MS/MSD samples.
- Sensitivity is evaluated through the review of RLs, blank analyses and holding time results.
- Accuracy is evaluated through the review of MS recoveries, LCS recoveries, internal standard recoveries, calibration, instrument performance checks, target analyte identification and quantitation and sample preservation.

- Representativeness is evaluated through the review of sample preservation and sampling containers.
- Comparability is evaluated through the review of the analytical methods and reporting procedures for consistency.
- Completeness is defined as the overall percentage of sample results that are determined to be usable.

14.2 Validation Procedures

Data Validation is a process of determining the suitability of a measurement system for providing useful analytical data. Data validation is essentially a three-step process in which the analytical data's quality assurance/quality control information is first compared to a series of QA/QC criteria. Based on the results of this comparison, the analytical data are then assigned qualifiers, which provide an indication of the data's usability. Finally, an overall evaluation of the data's usability is performed.

The analytical data generated for this investigation will be evaluated by RAMBOLL or KJ using the analytical methods utilized by the laboratories (as presented in this AQAPP), the QA/QC requirements listed in **Tables 3-1 to 3-19**, where applicable for each method, the laboratory SOP (where applicable) and professional judgment.

Full data validation consists of a review of data summary forms and raw analytical data that are provided in the data packages. During the full validation, data validators will recalculate selected laboratory sample calculations using raw data when verifying sample results. In addition, data validators will review raw data to verify that compound identification was performed correctly and transcription errors are not present.

Partial validation consists of a review of only analytical QC summary forms that are included in the data package. The forms and the information contained on the forms are not evaluated for accuracy or completeness during the partial validation process.

In the event that major analytical excursions are detected during the partial validation, full validation may be performed to further investigate the major excursion, upon approval of the RAMBOLL QAO or KJ Project Manager.

The following QA/QC information will be included in the full and partial validation, where applicable:

- AQAPP compliance
- Chain-of-custody record
- Sample collection
- Sample preservation
- Percent solids
- Percent lipids
- Holding times
- Calibrations (Full validation only) (Calibration response factor evaluation only for partial validation)

- Blank analysis
- MS/MSD analysis
- LCS analysis
- Field duplicate analysis
- Surrogate recovery
- Internal standards performance
- Recovery standard performance
- GC/MS instrument performance check (Full validation only)
- ICP interference check analysis
- ICP serial dilution analysis
- Laboratory duplicate analysis
- Sample dilutions (Full validation only)
- Target analyte quantitation, identification, and quantitation limits (RLs) (Full validation only)
- Documentation completeness

14.3 Assignment of Qualifiers

Data affected by excursions will be qualified using the approach to applying data validation qualifiers listed in the following documents and professional judgment:

- USEPA. 2006. USEPA Region II Validating PCB Compounds, PCBs by Gas Chromatography SW-846 Method 8082A, HW-45 Revision 1.
- USEPA. 2010. USEPA Region II Validating Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry SW-846 Method 8270D, SOP HW-22 Revision 5.
- USEPA. 2010. USEPA Region II, Validating Pesticide Compounds Organochlorine Pesticides by Gas Chromatography SW-846 Method 8081B. HW-44 Revision 1.1.
- USEPA. 2010. USEPA Region II, Validation of Data Nitroaromatics and NItroamines by HPLC, SW-846, Method 8330A. HW-16 Revision 2.1.
- USEPA. 2010. USEPA Region II Data Validation SOP For SW-846 Method 8290 Polychlorinated Dibenzodioxins (PCDDs) and Polychlorinated Dibenzofurans (PCDFs)By High Resolution Gas Chromatography/High Resolution Mass Spectrometry (HRGC/HRMS), HW-19, Revision 1.1.
- USEPA. 2010. USEPA Region II, Validating Chlorinated Herbicides, GC SW-846 Method 8151A, SOP HW-17, Revision 3.1.
- USEPA. 2014. USEPA Region II Standard Operating Procedure For the Validating Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry SW-846 Method 8260B & 8260C, SOP HW-24, Revision 4.
- USEPA. 2016a. USEPA Region II ICP-AES Data Validation, SOP No. 3a, Revision 1.
- USEPA. 2016b. USEPA Region II ICP-MS Data Validation, ISM02.0, SOP No. 3b, Revision 1.
- USEPA. 2016c. USEPA Region II, Mercury and Cyanide Data Validation, ISM02.2, SOP HW-3c Revision 1.

The application of these validation guidelines will be modified to reflect method, laboratory SOP and AQAPP requirements.

In accordance with the USEPA guidance, and utilizing professional judgment, the following qualifiers will be used in the data validation:

"R" Indicates that the RL or sample result is determined to be unusable due to a major deficiency in the data generation process. The data should not be used for any qualitative or quantitative purposes.

"U" Indicates that the analyte was analyzed for, but a concentration was not detected. The sample RL is reported. This qualifier is also used in the validation process to signify that the detection limit of an analyte was revised due to blank contamination.

"J" Indicates that the concentration should be considered approximate. This qualifier is used when the data validation process identifies a deficiency in the data generation process. This qualifier is also applied by the laboratory when the analyte concentration is greater than the MDL but less than the RL. In the latter case, the identification of the analyte is not in question but the quantitation of the analyte concentration may be uncertain.

"J+" The result is an approximate quantity, but the result may be biased high.

"J-" The result is an approximate quantity, but the result may be biased low.

"UJ" Indicates that the analyte was analyzed for, but a concentration was not detected. The sample RL is reported and should be considered approximate. This qualifier is used when the data validation process identifies a deficiency in the data generation process.

"JN " Indicates that there is presumptive evidence that the analyte is present, but it has not been confirmed due to confirmation excursions.

The following guidelines will be used regarding the assignment of qualifiers and the evaluation of data:

- The data quality evaluation results in only one type of qualifier ("U", "J", "UJ," or "R") for each analyte; in a case when several qualifiers are applicable to the same analyte, the cumulative effect of the various QA/QC excursions is employed in assigning the final data qualifiers. For example, if a sample result is affected by low surrogate recoveries, for which the "UJ" qualifier is applied, but low MS/MSD recoveries result in the rejection of the sample result (application of the "R" qualifier), the final data qualifier is the "R" qualifier.

14.4 Data Validation Report

The data validation report will contain separate QA sections in which data quality information collected during the investigation is summarized. The validation report will include the following:

- Guidelines used to evaluate the data;
- Data qualifiers applied to sample results;
- Summary of samples collected and analyses performed;

- Narrative that identifies major and minor analysis excursions detected for each parameter evaluated for each analysis;
- Additional issues and information that may be beneficial to the data user;
- Data summary forms.

The data validation report will be prepared under the direction of the RAMBOLL QAO or KJ Project Manager and will include the report on the usability of the data.

15. DATA ASSESSMENT PROCEDURES

15.1 Data QC Review

Data assessment is a systematic process of reviewing data against a set of criteria to identify outliers or errors and to delete suspect values or to flag them for the user. Laboratory data review starts with the laboratory quality control procedures discussed in Section 11 of this AQAPP.

Sample results obtained from the laboratory will be qualitatively and quantitatively assessed by the project team. Factors to be considered in the data assessment will include, but are not necessarily limited to, the following:

- Were all samples collected and handled using the custody procedures, methodologies and SOPs proposed in the AQAPP?
- Were samples obtained from all proposed sampling locations?
- Do any analytical results exhibit elevated laboratory RLs?
- Were any reported analytes not expected to be present?
- Which data points were found to be unusable based on the data validation results?
- Have sufficient data of appropriate quality been generated to meet the key objectives of the project as identified in this AQAPP?

15.2 Data Review

The internal laboratory data review process will be used to evaluate data. Data validation will be used to determine the quality and quantity of usable analytical data generated based upon the project specific AQAPP requirements.

15.3 Reconciliation with DQOs

PDI reports will include an evaluation of how representative the analytical results are of the medium being evaluated based on measures such as sampling design and quality control results. It will also include a discussion on the sufficiency of the data set for meeting project DQOs. The reports will also contain a discussion of any unusable data and follow up actions for subsequent data collection to meet the project DQOs.

15.4 Project Completeness Assessment

The RAMBOLL or KJ Project Manager will examine the project data for consistency with historical data, data quality, and usability.

16. PROJECT REPORTING

16.1 Data USABILITY/Validation Report

The data usability/validation report will contain separate QA sections in which data quality information collected during the investigation is summarized.

The data validation report will be prepared under the direction of the QAO and will include the report on the usability of the data.

16.2 Project Report

PDI reports will be prepared at the conclusion of each investigation and will include sample data results and the findings of that investigation.

NOTES:

* Indicates the laboratory performing this method is not certified by NJDEP; either the method certification is not available or the laboratory does not hold that certification.

*NO-NJDEP indicates the laboratory performing this method is not certified by NJDEP since method certification is not offered by NJDEP.

MS/MSD indicates matrix spike/matrix spike duplicate sample.

VOC indicates volatile organic compound.

SVOC indicates semivolatile organic compound.

PCB indicates polychlorinated biphenyls.

SIM indicates selected ion monitoring.

TOC indicates total organic carbon.

SPLP indicates synthetic precipitation leaching procedure.

HDPE indicates high density polyethylene.

AVS/SEM indicates acid-volatile sulfide/simultaneously-extracted metals.

Notes:

RLs indicates reporting limits.

MDLs indicate method detection limits.

ug/L indicates microgram per liter.

%R indicates percent recovery.

RPD indicates relative percent difference.

NA indicates not applicable.

MDLs and RLs provided by Eurofins Lancaster of Lancaster, PA, current as of January 2018.

* - Standard is for combined cis and trans 1,3-Dichloropropene

Target analyte detection limit exceeds regulatory criteria.

VOC Source List:

Target compound list (TCL) resource- USEPA. October 2016. Multi-Media, Multi-Concentration Organic Superfund Methods (SOM02.4). Washington, D.C.

Method reference

RPD indicates relative percent difference.

NA indicates not applicable.

MDLs and RLs provided by Pace Anayltical Services, current as of May 2019.

TCLP indicates toxicity characteristic leaching procedure.

Notes:

RLs indicates reporting limits.

MDLs indicate method detection limits.

ug/L indicates microgram per liter.

%R indicates percent recovery.

RPD indicates relative percent difference.

NA indicates not applicable.

MDLs and RLs provided by Eurofins Lancaster of Lancaster, PA, current as of January 2018.

Target analyte detection limit exceeds regulatory criteria.

* - Standard is for 2,4-Dinitrotoluene/2,6-Dinitrotoluene Mix

** - Standard is 50 µg/l for m-cresol and p-cresol separately

*** Freshwater criteria for pentachlorophenol are expressed as a function of pH. Criteria are derived in accordance with the formula set forth below:Acute criterion = e(1.005[pH]-4.869) ; Chronic criterion = e(1.005[pH]-5.134)

^ Site specific criteria

Target analyte detection limit exceeds regulatory criteria.

SVOC Source List:

Notes:

RLs indicates reporting limits.
MDLs indicate method detection limits.
ug/L indicates microgram per liter.
%R indicates percent recovery.
RPD indicates relative percent difference.
NA indicates not applicable.
SIM indicates selected ion monitoring.
MDLs, RLs and control limits provided by Pace Analytcial Services, current as of May 2019.
Target analyte detection limit exceeds regulatory criteria.
* - Standard is for 2,4-Dinitrotoluene/2,6-Dinitrotoluene Mix
** - Standard is 50 µg/l for m-cresol and p-cresol separately
*** Freshwater criteria for pentachlorophenol are expressed as a function of pH. Criteria are derived in accordance with the formula set forth below:Acute criterion = e(1.005[pH]-4.869) ; Chronic criterion = e(1.005[pH]-5.134)
^ Site specific criteria

SVOC Source List:

Target compound list (TCL) resource- USEPA. October 2016. Multi-Media, Multi-Concentration Organic Superfund Methods (SOM02.4). Washington, D.C.]

Method reference

1. USEPA. 2007. Test Methods for Evaluating Solid Waste: Physical/Chemical Methods, SW-846, 3rd Edition, Update IV. Washington D.C.

Regulatory Criteria:

1- NJDEP Class IIA Aqufer: Higher of PQL and GWQC, current as of January 2018.
1- NJDEP Ecological Screening Criteria, current as of January 2018.

Notes:

RLs indicates reporting limits.

MDLs indicate method detection limits.

ug/Kg indicates microgram per killogram.

%R indicates percent recovery.

RPD indicates relative percent difference.

NA indicates value not applicable, a standard has not been established.

MDLs and RLs provided by Eurofins Lancaster of Lancaster, PA, current as of January 2018.

Target analyte detection limit exceeds regulatory criteria.

* Standard for 4-Methylphenol

^ Site specific criteria

SVOC Source List:

Target compound list (TCL) resource- USEPA. October 2016. Multi-Media, Multi-Concentration Organic Superfund Methods (SOM02.4). Washington, D.C.]

Notes:

RLs indicates reporting limits.

MDLs indicate method detection limits.

ug/L indicates microgram per liter.

%R indicates percent recovery.

RPD indicates relative percent difference.

NA indicates not applicable.

NC indicates laboratory is not certified for this target analyte at this project site.

MDLs and RLs provided by Eurofins Lancaster of Lancaster, PA (ELLE) and Pace Analytical Laboratories of Madison, WI, current as of January 2018.

*Standard is for 2,4-Dinitrotoluene and 2,6-Dinitrotoluene Mix

Target analyte detection limit exceeds regulatory criteria.

^ Site specific standard

Dioxin and Dibenzofuran target analyte list source:

Notes:

RLs indicates reporting limits.
MDLs indicate method detection limits.
ug/L indicates microgram per liter.
%R indicates percent recovery.
RPD indicates relative percent difference.
NA indicates not applicable.
NC indicates laboratory is not certified for this target analyte at this project site.
MDLs and RLs provided by Eurofins Lancaster of Lancaster, PA (ELLE) and Pace Analytical Laboratories of Madison, WI, current as of January 2018.
^ Site specific criteria
Target analyte detection limit exceeds regulatory criteria.

Notes:

RLs indicates reporting limits.
MDLs indicate method detection limits.
ug/Kg indicates microgram per killogram.
NA indicates value not applicable, a standard has not been established.'
%R indicates percent recovery.
RPD indicates relative percent difference.
AVS indicates Acid-Volatile Sulfide.
SEM indicates Simuntaneously-Extracted Metals.
SSE indicates Selective Sequential Extraction.
MDLs and RLs provided by Eurofins Lancaster of Lancaster, PA (ELLE), Eurofins Frontier Global Sciences of Bothell, Washington (EFGS) and CT Laboratories of Baraboo, Wisconsin (CT), current as of January 2018.
^ Site specific criteria
Target analyte detection limit exceeds regulatory criteria.

Regulatory Criteria:

TCLP regulatory criteria as of May 2019.

Table 3-1. VOCs using USEPA Methods 8000C/8260C quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Sample preservation	Samples must be preserved based on method and QAPP requirements	For aqueous samples: cooler temperature ≤6°C, preserve with HCL to pH≤2, Sealed and Headspace Free. For solid samples: cooler temperature ≤6°C, See Table 1 for sample preservation information.	Notify Project Manager since re-sampling may be required. Document corrective action in the case narrative.
Holding times (Sensitivity)	Samples must be analyzed within holding time.	See Table 1 For aqueous and solid samples: Analyze within 14 days from collection for preserved samples. Analysis within 7 days from collection to analysis for aqueous samples not acid preserved. For SPLP -14 days from collection to extract generation. 14 days from extract generation to analysis. See Table 1 for sample collection information.	If holding times are exceeded for initial or any re-analyses required due to QC excursions, notify QAO since re-sampling may be required. Document corrective action in the case narrative.
MS Tuning (Accuracy)	Once every 12 hours prior to initial calibration and calibration verifications. Analytical sequence must be completed within 12 hours of the GC/MS Instrument Performance Check	Bromofluorobenzene (BFB) key ions and abundance criteria listed in the method Table 3 or Lab SOP must be met for all 9 ions and analyses must be performed within 12 hours of injection of the BFB. Part of the BFB peak will not be background subtracted to meet tune criteria. Documentation of all bromofluorobenzene analyses and evaluation must be included in the data packages.	Tune the mass spectrometer. Document corrective action in the case narrative. Samples cannot be analyzed until control limit criteria have been met.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Initial Calibration Initial Calibration Verification (ICV) **(Accuracy)**	Prior to sample analysis and when calibration verifications criteria are not met. Initial calibration will contain all target analytes in each standard. Quantitation of analyses will utilize the initial calibration results.	A minimum of five concentrations bracketing expected concentration range for all compounds of interest. One standard must be analyzed at or below the RL concentration. One second-source standard (ICV) must be analyzed immediately following the initial calibration at the mid-calibration concentration. This standard must be within 30% recovery or within laboratory control limits. It is also recommended that a separate standard at the MDL level be analyzed after calibration is complete to check sensitivity. Response factor (RF) as listed in Table 4, Method 8260C. The following exceptions are allowed: RFs ≥ 0.010 for poor purging target analytes such as ketones, acetonitrile, acrolein, propionitrile, vinyl acetate, 1,4-dioxane, alcohols, tetrahydrofuran, and cyclohexanone. For other target analytes not listed on Table 4, RFs ≥ 0.050. For Ketones listed in Table 4 with RFs ≥ 0.010 and less than 0.100 results, data will be qualified as approximate (UJ, J). For compound with %RSD >20, quantitation must be performed using a separate calibration curve and the Coefficient of Determination (COD) must be ≥ 0.99. If linear regression is used for the calibration curve, the low initial calibration standard should be evaluated for accuracy using criteria of %D <30% from true value. Relative retention time (RRT) for each target analyte in each calibration standard must agree within ± 0.06 RRT units	Identify and correct problem. If criteria are still not met, recalibrate. Document corrective action in the case narrative. Samples should not be analyzed until calibration control limit criteria are met. Response factor excursions may result in rejected data during data validation. Contact QAO to discuss problem target analytes before proceeding with analysis.
Calibration **Verification (Accuracy)**	Every 12 hours, following BFB. The calibration verification will contain all target analytes in each standard at a concentration that is representative of the midpoint of the initial calibration.	Within percent drift or percent difference (%D) ≤ 20 for compound. RFs must meet the criteria listed for initial calibration. The internal standards areas and retention times must meet the method criteria.	Reanalyze. If criteria are still not met, identify and correct problem, recalibrate. Document corrective action in the case narrative; samples should not be analyzed until calibration control limit criteria are met.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Preparation Blank Analysis **(Sensitivity)**	Every 12 hours, following calibration verification	Methylene chloride less than 3 times RL and 2-butanone and acetone less than 5 times RL remaining analytes less than RL will be provided along with the preparation blank results.	Reanalyze blank. If limits are still exceeded, clean instrument, recalibrate analytical system, and reanalyze all samples if detected for same compounds as in blank. Document corrective action in the case narrative - samples cannot be analyzed until blank criteria have been met.
Field Blank Analysis **(Sensitivity)**	Collected per QAPP requirements.	Methylene chloride less than 3 times RL and 2-butanone and acetone less than 5 times RL. Remaining analytes less than RL.	Investigate problem. Document in the case narrative.
Trip Blank **(Sensitivity)**	1 per cooler containing VOC samples.	Methylene chloride less than 3 times RL and 2-butanone and acetone less than 5 times RL. Remaining analytes less than RL.	Investigate problem. Document in the case narrative.
Laboratory Control Sample Analysis **(Accuracy)**	Each analytical batch (every 12 hours). Prepared independently from calibration standards. Spike must contain all target analytes and should be at a concentration, which is in the lower 1/2 of the calibration curve.	Recovery within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	If recovery failures are above control limits and these compounds are not detected in the associated samples, corrective action is not required. If recovery failures are below control limits, reanalyze LCS and examine results of other QC analyses. If other QC criteria have not been met, stop analysis, locate and correct problem, recalibrate instrument and reanalyze samples since last satisfactory LCS. Document corrective action in the case narrative.
Internal Standards **(Accuracy)**	All samples and blanks(including MS/MSD)	Response -50% - +200% of internal standards from continuing calibration of the day. RT must be ± 30 sec. from associated calibration verification standard of that sequence.	Reanalyze. If still outside of the limits, report both analyses. Document corrective action in the case narrative.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Surrogate Spike **(Accuracy)**	All samples and blanks (including MS/MSD)	Recovery within laboratory control limits. The lowest acceptable control limits for recovery will be 10%.	Reanalyze any environmental or QC sample with surrogates that exceed control limits. If still outside of the limits, report both analyses. Document corrective action in the case narrative.
Matrix Spike/ **Matrix Spike Dup. (MS/MSD) Analysis** **(Accuracy/Precision)**	Collected per QAPP requirements. Samples from the investigation must be used for MS/MSD analysis. Spike must contain complete list of target analytes.	Recovery and RPD within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	Reanalyze if <10%. It is recommended that if reanalysis is still <10%, report both analyses and document in the case narrative. If >10% and LCS criteria are met, document in case narrative; no additional corrective action required. If LCS criteria are exceeded also, examine other QC data for source of problem; i.e., surrogate recoveries for extraction efficiency and calibration data for instrument performance issues. Reanalyze samples and associated MS/MSD and LCSs as required. Document corrective action in the case narrative
Field Duplicate Analysis (Precision)	Collected per QAPP requirements. Field duplicate will not be identified to the laboratory.	Validation criteria: 30% RPD for waters, 50% RPD for solids. For sample results that are less than or equal to five times the RL, the criterion of plus or minus two times the RL will be applied to evaluate field duplicates.	No corrective action required of the laboratory since the laboratory will not know the identity of the field duplicate samples. If these criteria are not met, sample results will be evaluated on a case-by-case basis.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Target Analyte Identification **(Accuracy)**	As required for identification of target analytes	The intensities of the characteristic ions of a compound maximize in the same scan or within one scan of each other. Selection of a peak by a data system target compound search routine where the search is based on the presence of a target chromatographic peak containing ions specific for the target compound at a compound-specific retention time will be accepted as meeting this criterion. The relative retention time (RRT) of the sample component is within ± 0.06 RRT units of the RRT of the standard component. The relative intensities of the characteristic ions agree within 30% of the relative intensities of these ions in the reference spectrum. (Example: For an ion with an abundance of 50% in the reference spectrum, the corresponding abundance in a sample spectrum can range between 20% and 80%.) Structural isomers that produce very similar mass spectra should be identified as individual isomers if they have sufficiently different GC retention times Identification is hampered when sample components are not resolved chromatographically and produce mass spectra containing ions contributed by more than one analyte. When gas chromatographic peaks obviously represent more than one sample component (i.e., a broadened peak with shoulder(s) or a valley between two or more maxima), appropriate selection of analyte spectra and background spectra is important.	Not applicable
Target Analyte Identification **(Accuracy)**	As required for identification of target analytes	Examination of extracted ion current profiles of appropriate ions can aid in the selection of spectra, and in qualitative identification of compounds. When analytes co-elute (i.e., only one chromatographic peak is apparent), the identification criteria may be met, but each analyte spectrum will contain extraneous ions contributed by the co-eluting compound.	Not applicable
Target Analyte Quantitation **(Accuracy)**	Apply USEPA Method 8000C for medium level extraction technique	Moisture correction in accordance with USEPA Method 8000C will be applied to the complete set of solid samples, regardless of the percent moisture content.	Not applicable
Tentatively Identified Compound **(Accuracy)**	If required, perform for each sample and blank analysis. Non-target compounds will be reported using a Mass Spectral Library search.	Not applicable	Not applicable

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Dilutions	When target analyte concentration exceeds upper limit of calibration curve. When matrix interference is demonstrated by the lab and documented in the case narrative (highly viscous samples or a large number of nontarget peaks on the chromatogram). It is recommended that a reagent blank be analyzed if an analyte saturates the detector or if highly concentrated analytes are detected. Otherwise data impacted from carryover cannot be used. Laboratory will note in the data deliverables which analytical runs were reported.	The reagent blank will meet the method blank criteria.	Reanalyze reagent blank until method blank criteria are met. Document corrective action in the case narrative.
pH Determination	Once sample aliquot is taken from the VOC vial, the pH of water samples must be determined.	Record pH and report in the case narrative. pH logs may be requested during data validation.	Not applicable
Sample Batching	The laboratory will batch project samples together along with QC samples specified from the project. Non-project information will not be included in the data packages.	Not applicable	Not applicable
Percent solids	For solid samples, the percent solids will be determined and sample results will be corrected for percent solids.	Not applicable	Not applicable
Laboratory control limits	Generated with results for an analyte from a minimum of 20 sample analyses. The average of the sample results and the standard deviation are calculated. The internal warning limits are established at 2 times the standard deviation and the control limits are established at 3 times the standard deviation. The control limits are updated annually.	Not applicable	Not applicable

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Deliverables as required	. Full NJDEP deliverables must be provided to document each audit item for easy reference and inspection. . It is recommended that an example calculation be provided for each analysis, for each type of matrix in the data package using samples from the project. . Any laboratory abbreviations or notations presented in the raw data or summary information will be explained or referenced in the case narrative. . Final spiking concentrations will be presented in summary form. . Standard tracing information will be provided. . Cooler temperatures and any observations of bubbles in sample containers will be provided in the data packages. . Run logs will be provided in the data packages.	Not applicable	Provide missing or additional deliverables for validation purposes.
Method and QAPP requirements	The laboratory will perform the method as presented in this QAPP and will adhere to the QAPP requirements presented herein. Otherwise the laboratory will specifically note any procedures that differ from the method or the QAPP in the data package case narrative.	Not applicable	Not applicable

Notes:

Data validation will be performed in accordance with QA/QC criteria established in these tables and the analytical methods. Excursions from QA/QC criteria will be qualified based on guidance provided in this QAPP.

Communications with O'Brien & Gere will be documented and included in the data packages.

Source: O'Brien & Gere

3-2. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Sample preservation	Samples must be preserved based on method and QAPP requirements	For aqueous and soil samples: cooler temperature ≤6°C. See Table 1 for sample preservation information.	Notify Project Manager since re-sampling may be required. Document corrective action in the case narrative.
Holding times (Sensitivity)	Samples must be extracted and analyzed within holding time.	Extract within 7 days from collection for aqueous samples; 14 days from collection for soil samples. Analyze extracts within 40 days of extraction. For SPLP - 14 days from collection to extract generation. 7 days from extract generation to extraction. 40 days from extraction to analysis See Table 1 for sample collection information.	If holding times are exceeded for initial or any re-analyses required due to QC excursions, notify the QAO since re-sampling may be required.
MS Tuning (Accuracy)	Once every 12 hours prior to initial calibration and calibration verification. Must contain 50ng/uL of 4,4-DDT, pentachlorophenol, and benzidine.	1. DFTPP key ions and abundance criteria listed in the method or Laboratory SOP must be met for all 13 ions and analyses must be performed within 12 hours of injection of the DFTPP. 2. Part of the DFTPP peak will not be background subtracted to meet tune criteria. 3. Documentation of all DFTPP analyses and evaluations must be included in the data packages. 4. Degradation of 4,4-DDT <20%. 5. Tailing factor of ≤2 for benzidine and pentachlorophenol.	1. Tune the mass spectrometer. 2. Document any observations and corrective action in the case narrative - samples cannot be analyzed until control limit criteria have been met.

RAMBOLL

3-2. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Initial Calibration Verification (ICV) (Accuracy) **Initial Calibration Verification (ICV) (Accuracy)**	Prior to sample analysis and when calibration verification criteria are not met. Initial calibration will contain all target analytes in each standard. Quantitation of analyses will utilize the initial calibration results.	1. A minimum of five concentrations bracketing expected concentration range for all compounds of interest with one standard at or less than the RL 2. One second-source standard should be analyzed immediately following the initial calibration at the mid-calibration concentration. This standard must be within 30% recovery or within laboratory control limits. 3. It is also recommended that a separate standard at the MDL level be analyzed after calibration is complete to check sensitivity. 4. RFs must meet criteria listed in Method 8270D; remaining RFs must be 0.05. 6. For compounds with %RSD >20, quantification must be performed using a separate calibration curve and the COD must be ≥ 0.99. If linear regression is used for the calibration curve, the low level initial calibration standard should be evaluated for accuracy using criteria of %D < 30% from the true value. 8. Relative retention for each target analyte in each calibration standard must agree within ± 0.06 units.	1. Identify and correct problem. 2. If criteria are still not met, recalibrate. 3. Document any observations and corrective action in the case narrative - samples should not be analyzed until calibration control limit criteria are met.
Calibration Verification (Accuracy)	Every 12 hours, following DFTPP. Calibration verification will contain all target analytes in each standard at a concentration that is representative of the midpoint of the initial calibration.	1. Within method specified criteria, percent drift or percent difference (%D) ≤ 20 for target analytes. Response factor requirements as listed in initial calibration. *2.* The internal standards areas and retention times must meet the method criteria.	1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate. 3. Document any observations and corrective action in the case narrative - samples should not be analyzed until calibration control limit criteria are met.
Preparation Blank Analysis (Sensitivity)	Prepared with each extraction batch of no more than 20 analytical samples.	1. Common laboratory contaminants (phthalate) less than 5 x RL. Remaining analytes less than RL. 2. RLs and MDLS will be provided along with the preparation blank results.	1. Reanalyze blank. 2. If limits are still exceeded, clean instrument, recalibrate analytical system and re-extract and reanalyze all samples if detected for same compounds as in the blank. 3. Document any observations and corrective action in the case narrative - samples should not be analyzed until blank criteria have been met.

3-2. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Field Blank Analysis (Sensitivity)	Collected per QAPP requirements.	1. Common laboratory contaminants (phthalate) less than 5 x RL. Remaining analytes less than RL.	1. Investigate problem. 2. Document any observations and corrective actions in the case narrative.
Laboratory Control Sample Analysis (Accuracy)	Prepared with each extraction batch, of no more than 20 analytical samples. Prepared independently from calibration standards. Spike must contain all target compounds and should be at a concentration that is approximately in the lower 1/2 of the calibration curve.	Recovery within laboratory control limits. For compounds without established laboratory control limits, 70 to 130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	1. If recovery failures are above control limits and these compounds are not detected in the associated samples, no corrective action is required. 2. If recovery failures are below the control limits, reanalyze LCS and examine results of other QC analyses. 3. If other QC criteria have not been met, stop analysis, locate and correct problem, recalibrate instrument and reanalyze samples since last satisfactory LCS. 4. Document any observations and corrective action in the case narrative.
Internal Standards (Accuracy)	All samples and blanks (including MS/MSD).	Response -50% - +200% of the internal standards from the continuing cal of the day. RT must be ± 30 sec. from calibration verification of that sequence.	Reanalyze. If the re-analysis meets criteria or demonstrates fewer excursions, report the re-analysis result. If the re-analysis does not meet criteria or demonstrates fewer excursions, report the initial analysis and include raw data for both analyses in the data package. Document corrective action in the case narrative.

3-2. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Surrogate Spike (Accuracy)	All samples, and blanks (including MS/MSD).	Recovery within laboratory control limits. The lowest acceptable control limits for recovery will be 10%.	1. Reanalyze if more than 1 AE or 1 BN fails or if any one surrogate recovery is < 10%. 2. If re-analysis meets criteria, report re-analysis result. 3. If reanalysis recovery fails criteria but recovery is >10%: a. Report the analysis that demonstrates fewer excursions and include raw data for both analyses in the data package. 4. If re-analysis recovery is < 10%, re-extract and re-analyze sample. 5. For re-extracted sample, report the analysis that meets criteria or demonstrates fewer excursions and include raw data for both analyses in the data package. 6. Document corrective action in the case narrative.
Matrix Spike/ Matrix Spike Dup. (MS/MSD) Analysis (Accuracy/Precision)	Collected per QAPP requirements. Samples from the investigation must be used for MS/MSD analysis. Spike must contain complete list of target analytes.	Recovery and RPD within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	1. Reanalyze if <10%. 2. It is recommended that if reanalysis is < 10%, report both analyses and document in the case narrative. 3. If reanalysis is >10%, and LCS criteria are met, document in the case narrative. 4. If LCS criteria are exceeded also, examine other QC data for source of problem; i.e. surrogate recoveries for extraction efficiency and calibration data for instrument performance issues; re-extract or reanalyze samples and associated MS/MSD and LCSs as required.
Field Duplicate Analysis (Precision)	Collected per QAPP requirements. Field duplicate will not be identified to the laboratory.	Validation criteria: 30% RPD for waters, 50% RPD for solids. For sample results that are less than or equal to five times the RL, the criterion of plus or minus two times the RL will be applied to evaluate field duplicates.	No corrective action required of the laboratory since the laboratory will not know the identity of the field duplicate samples. If these criteria are not met, sample results will be evaluated on a case-by-case basis.

3-2. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Target Analyte Identification (Accuracy)	As required for identification of target analytes	1. The intensities of the characteristic ions of a compound maximize in the same scan or within one scan of each other. Selection of a peak by a data system target compound search routine where the search is based on the presence of a target chromatographic peak containing ions specific for the target compound at a compound-specific retention time will be accepted as meeting this criterion. 2. The relative retention time (RRT) of the sample component is within ± 0.06 RRT units of the RRT of the standard component. 3. The relative intensities of the characteristic ions agree within 30% of the relative intensities of these ions in the reference spectrum. (Example: For an ion with an abundance of 50% in the reference spectrum, the corresponding abundance in a sample spectrum can range between 20% and 80%.) 4. Structural isomers that produce very similar mass spectra should be identified as individual isomers if they have sufficiently different GC retention times. 5. Identification is hampered when sample components are not resolved chromatographically and produce mass spectra containing ions contributed by more than one analyte. When gas chromatographic peaks obviously represent more than one sample component (i.e., a broadened peak with shoulder(s) or a valley between two or more maxima), appropriate selection of analyte spectra and background spectra is important.	Not applicable
Target Analyte Identification (Accuracy)		6. Examination of extracted ion current profiles of appropriate ions can aid in the selection of spectra, and in qualitative identification of compounds. When analytes co-elute (i.e., only one chromatographic peak is apparent), the identification criteria may be met, but each analyte spectrum will contain extraneous ions contributed by the co-eluting compound.	

RAMBOLL

3-2. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Screening samples	As required for samples suspected to contain high concentrations or matrix interferences	It is highly recommended that samples be screened prior to analysis. Screening data (performed prior to the initial analysis) does not need to be included in the data package. Data for samples analyzed at dilutions for initial or subsequent analyses is required to be included in the data package.	Not applicable
Cleanup	Gel permeation chromatography (GPC) should be performed for water extracts with high molecular weight contaminants.	Calibrate according to method. Criteria must be met as listed in method for calibration and blank analysis.	Clean GPC column or replace.
Tentatively Identified Compound (Accuracy)	If required, for each sample and blank analysis. Non-target compounds will be reported using a Mass Spectral Library search.	Not applicable	Not applicable
Sample Batching	The laboratory will batch project samples together along with QC samples specified from the project. Non-project information will not be included in the data packages.	Not applicable	Not applicable
Percent solids	For solid samples, the percent solids will be determined and sample results will be corrected for percent solids.	Not applicable	Not applicable
Dilutions	1. When target analyte concentration exceed upper limit of calibration curve. 2. When matrix interference demonstrated by lab and documented in the case narrative (highly viscous samples or a large number of non-target peaks on the chromatogram). 3. Samples should be cleaned up during sample preparation/extraction procedure using appropriate methods when matrix interference is present. 4. Laboratory will note in the data deliverables which analytical runs were reported.	The laboratory will not dilute samples unless elevated concentrations of target analytes or matrix interference is demonstrated in the samples.	Not applicable

3-2. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Laboratory control limits	1. Generated with results for an analyte from a minimum of 20 sample analyses. The average of the sample results and the standard deviation are calculated. The internal warning limits are established at 2 times the standard deviation and the control limits are established at 3 times the standard deviation. The control limits are updated biannually.	Not applicable	Not applicable
Deliverables as required	1. Full NJDEP deliverables must be provided to document each audit item for easy reference and inspection. 2. It is recommended that an example calculation be provided for each analysis, for each type of matrix in the data package using samples from the project. 3. Any laboratory abbreviations or notations presented in the raw data or summary information will be explained or referenced in the case narrative. 4. Final spiking concentrations will be presented in summary form. 5. For the initial data package, standard tracing information will be provided. 6. Cooler temperatures will be provided in the data packages. 7. Run logs will be provided in the data packages.	Not applicable	Provide missing or additional deliverables for validation purposes.
Method and QAPP requirements	The laboratory will perform the method as presented in this QAPP and will adhere to the QAPP requirements presented herein. Otherwise the laboratory will specifically note any procedures that differ from the method or the QAPP in the data package case narrative.	Not applicable	Not applicable

Notes:

Data validation will be performed in accordance with QA/QC criteria established in these tables and the analytical methods that are currently used by the laboratory. Excursions from QA/QC criteria will be qualified based on guidance provided in this QAPP.

Communications with the QAO will be documented and included in the data packages.

Source: O'Brien & Gere

Table 3-3. PCBs using USEPA Methods 8000C/8082A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Sample preservation	Samples must be preserved based on method and QAPP requirements	For aqueous and soil samples: cooler temperature ≤6°C. See Table 1 for sample preservation information.	Notify Project Manager since re-sampling may be required. Document corrective action in the case narrative.
Holding Times **(Sensitivity)**	Samples must be extracted and analyzed within holding time.	Extract within 7 days from collection for aqueous samples and 14 days from collection for solid samples. Analyze extracts within 40 days of extraction. For SPLP - 14 days from collection to extract generation. 7 days from extract generation to extraction. 40 days from extraction to analysis See Table 1 for sample collection information.	If holding times are exceeded for initial or any re-analyses required due to QC excursions, notify the QAO since re-sampling may be required.

Table 3-3. PCBs using USEPA Methods 8000C/8082A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Initial Calibration Initial Calibration Verification (ICV) **(Accuracy)**	Prior to start up and when criteria are exceeded for continuing calibration. Calibrations must contain all target analytes. Quantitation of analyses will utilize the initial calibration results.	1. Minimally five concentrations for Aroclor 1016/1260 (one point calibration for the remaining Aroclors), one calibration standard must be at concentration less than or equal to the RL. 2. One second-source standard (ICV) should be analyzed immediately following the initial calibration at the mid-calibration concentration. This standard must be within 30% recovery. 3. It is recommended that if results are reported below the RL, a separate standard at the MDL level analyzed after calibration is complete to check sensitivity. 4 It is recommended that if results are reported below the RL, a second-source standard (initial validation verification) at the MDL level analyzed after calibration is complete to check sensitivity with %D <30. at the mid-calibration concentration. 4. If RSD ≤20%, the average relative response factor (internal calibration) or average calibration factor (external calibration) is used for quantitation. If RSD >20%, a linear regression calibration that does not pass through the origin with a correlation coefficient (r) ≥0.990 is used for quantitation; or a nonlinear first or second order calibration curve with a coefficient of determination (COD) of ≥0.990 is used for quantitation.	1. Identify and correct problem. 2. If criteria are still not met, recalibrate. 3. Document any observations and corrective action in the case narrative - samples should not be analyzed until calibration control limit criteria are met.
Calibration **Verification (Accuracy)**	Calibration standards must contain Aroclor 1016/1260 at the mid-range concentration. Calibration verification standards must be analyzed every 20 samples and must bracket each end of the sample sequence. In the case that Aroclors are detected above the MDL concentration in the associated samples, the identified Aroclor must be analyzed within the same 48 hour period as the sample in a valid analytical sequence.	Calibration verification response %D ≤ 20%. RT for each target analyte must be within established RT windows.	1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate; reanalyze samples back to last compliant calibration standard. Samples must be bracketed by compliant calibration standards. 3. Document corrective action in the case narrative.

Table 3-3. PCBs using USEPA Methods 8000C/8082A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Retention Time Windows **(Accuracy)**	Retention time windows (absolute retention time) must be established in accordance with USEPA Method 8000B/8000C or relative retention times must be used if internal standards are employed.	Compounds must be within established retention time windows or within laboratory established relative retention time criteria for the succeeding calibration standards. It is recommended that retention time windows be provided for each calibration verification. Retention times for each surrogate analyzed for samples and QC samples should be provided on a summary form.	1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate; reanalyze samples back to last compliant calibration standard. 3. Document corrective action in the case narrative.
Method Blank Analysis **(Sensitivity)**	Prepared with each extraction batch of no more than 20 analytical samples.	1. Less than RL. 2. RLs and MDLS will be provided along with the preparation blank results.	1. Reanalyze blank. 2. If limits are still exceeded, clean instrument, recalibrate analytical system and re-extract and reanalyze all samples if detected for same compounds as in the blank. 3. Document any observations and corrective action in the case narrative - samples should not be analyzed until blank criteria have been met.
Field Blank Analysis **(Sensitivity)**	Collected per QAPP requirements.	Less than RL	Investigate problem. Document any observation or in the case narrative.
Instrument Blank Analysis **(Sensitivity)**	Must be analyzed at the beginning of 12 hour sequence, following the initial calibration verification standard.	Less than RL	1. Reanalyze. 2. If limits are still exceeded, re-extract and reanalyze method blank and associated samples. Samples must not be analyzed until method blank criteria are met. 3. Document corrective action in the case narrative.

Table 3-3. PCBs using USEPA Methods 8000C/8082A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Laboratory Control Sample Analysis **(Accuracy)**	Prepared with each extraction batch, of no more than 20 analytical samples. Prepared independently from calibration standards LCS will be spiked with the Aroclor 1016/1260 at concentrations near the mid point of the calibration curve. Other Aroclors may be used in the LCS analysis if requested.	Recovery within laboratory control limits. For compounds without established laboratory control limits, 70 to 130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	1. If recovery failures are above control limits and these compounds are not detected in the associated samples, no corrective action is required. 2. If recovery failures are below the control limits, reanalyze LCS and examine results of other QC analyses. 3. If other QC criteria have not been met, stop analysis, locate and correct problem, recalibrate instrument and reanalyze samples since last satisfactory LCS. 4. Document any observations and corrective action in the case narrative.
Matrix Spike/ **Matrix Spike Dup. (MS/MSD) Analysis** **(Accuracy/Precision)**	Field collected at a frequency listed in the QAPP MS/MSDs will be spiked with the Aroclor 1016/1260 at concentrations near the midpoint of the calibration curve. Other Aroclors maybe be used in the MS/MSD analysis if requested. Samples from the investigation must be used for MS/MSD analysis.	Recovery and RPD within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	1. Reanalyze if <10%. 2. It is recommended that if reanalysis is < 10%, report both analyses and document in the case narrative. 3. If reanalysis is >10%, and LCS criteria are met, document in the case narrative. 4. If LCS criteria are exceeded also, examine other QC data for source of problem; i.e. surrogate recoveries for extraction efficiency and calibration data for instrument performance issues; re-extract or reanalyze samples and associated MS/MSD and LCSs as required.

Table 3-3. PCBs using USEPA Methods 8000C/8082A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Surrogate Spike **(Accuracy)**	Samples, blanks, MS/MSDs, and LCSs must be spiked with method specified surrogate compounds on each column used in the analysis.	Recovery within laboratory control limits. Corrective action is not required if one of the four surrogates (for two columns) has recovery outside of control limits if the recovery is >10% and the remaining three surrogates are within control limits. Surrogate recoveries for each surrogate on each column must be provided in a summary form. The lowest acceptable control limits for recovery will be 10%.	1. Reanalyze. 2. If re-analysis meets criteria, report re-analysis result. 3. If reanalysis recovery fails criteria but recovery is >10%: a. Report the analysis that demonstrates fewer excursions and include raw data for both analyses in the data package. 4. If re-analysis recovery is < 10%, re-extract and re-analyze sample. 5. For re-extracted sample, report the analysis that meets criteria or demonstrates fewer excursions and include raw data for both analyses in the data package. 6. Document corrective action in the case narrative.
Field Dup. Analysis (Precision)	Collected per QAPP requirements. Field duplicate will not be identified to the laboratory.	Validation criteria: 30% RPD for waters, 50% RPD for solids. For sample results that are less than or equal to five times the RL, the criterion of plus or minus two times the RL will be applied to evaluate field duplicates.	No corrective action required of the laboratory since the laboratory will not know the identity of the field duplicate samples. If these criteria are not met, sample results will be evaluated on a case-by-case basis.
Target Analyte Identification **(Accuracy)**	As required for identification of target analytes	Retention times must be within established retention time windows or must meet relative retention time criteria. Confirmation analysis is required. It is recommended that retention time windows must be provided for each calibration verification. USEPA CLP Form 10 Summary form, providing the percent difference and retention times for all detected analytes in samples and QC samples, will be provided.	1. Investigate problem; reanalyze calibration standards to check for retention time shift. 2. Document corrective action in the case narrative.

Table 3-3. PCBs using USEPA Methods 8000C/8082A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Quantitation (Accuracy)	Samples, blanks, and QC data.	Confirmation analysis is required. Internal or external standard method may be used. Verify concentration is within linear calibration range of standards. Percent difference must be less than 40% (method requirement): Percent Difference - Difference between Primary column concentration and the Confirmation column divided by the Primary column times 100. If result for lower concentration is reported, Percent Difference - Difference between lower concentration and higher concentration divided by lower concentration times 100. Aroclor concentration is determined using response factor for each of the characteristic peaks and then averaging the five concentrations. Peak areas from a minimum of three Aroclor peaks unique to the target Aroclor will be used to quantitate the Aroclor concentration. Every effort must be made to meet specified RL requirements. Lab must state the technique used for quantitation of results for the samples.	1. If concentration is above linear calibration range, dilute sample and reanalyze. Dilution should result in concentration in the upper calibration range of the instrument. 2. Document corrective action in the case narrative.
Chromatography Presentation	For each standard, sample and QC sample analysis.	Copies of chromatograms provided in the data package must be large enough to view during validation; detail of each peak involved in the Aroclor identification, including peak shape and associated baseline. In the case that matrix interference is detected or manual integration is performed, enlarged copies of those manipulations will be included in the data package for review.	1. Provide requested information.
Cleanup	Acid wash clean-up is required for PCB extracts.	Not applicable	Not applicable

Table 3-3. PCBs using USEPA Methods 8000C/8082A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Screening samples	As required for samples suspected to contain high concentrations or matrix interferences	It is highly recommended that samples be screened prior to analysis. Screening data (performed prior to the initial analysis) does not need to be included in the data package. Data for samples analyzed at dilutions for initial or subsequent analyses is required to be included in the data package.	Not applicable
Sample Batching	The laboratory will batch project samples together along with QC samples specified from the project. Non-project information will not be included in the data packages. USEPA Form 8 Summary form, providing the date, time of analysis of samples and QC samples, surrogate retention times and surrogate retention time window, should be provided.	Not applicable	Not applicable
Confirmation Analysis	Dual column quantitation and qualitative confirmation is required. The information presented in CLP Form 10 will be provided in the data package for evaluation.	Not Applicable	Not Applicable
Laboratory control limits	Generated with results for an analyte from a minimum of 20 sample analyses. The average of the sample results and the standard deviation are calculated. The internal warning limits are established at 2 times the standard deviation and the control limits are established at 3 times the standard deviation. The control limits are updated annually.	Not applicable	Not applicable
Percent solids	For solids samples, the percent solids will be determined and sample results will be corrected for percent solids.	Not applicable	Not applicable

Table 3-4. Pesticides using USEPA Methods 8000C/8081B quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Sample preservation	Samples must be preserved based on method and QAPP requirements	For aqueous and soil samples: cooler temperature ≤6°C. See Table 1 for sample preservation information.	Notify Project Manager since re-sampling may be required. Document corrective action in the case narrative.
Holding Times **(Sensitivity)**	Samples must be extracted and analyzed within holding time.	Extract within 7 days from collection for aqueous samples and 14 days from collection for solid samples. Analyze extracts within 40 days of extraction. For SPLP - 14 days from collection to extract generation. 7 days from extract generation to extraction. 40 days from extraction to analysis See Table 1 for sample collection information.	1. If holding times are exceeded for initial or any re-analyses required due to QC excursions, notify the Project Manager immediately since re-sampling may be required. 2. Document any observations and corrective action in the case narrative.

Table 3-4. Pesticides using USEPA Methods 8000C/8081B quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Initial Calibration Initial Calibration Verification (ICV) **(Accuracy)**	Prior to start up and when criteria are exceeded for continuing calibration. Calibrations must contain all target analytes. Quantitation of analyses will utilize the initial calibration results.	1. Minimally five concentrations for each single component analyte. One calibration standard must be at concentration less than or equal to the RL. 2. It is recommended that one second-source ICV standard be analyzed immediately following the initial calibration at the mid-calibration concentration. This standard must be within 30% recovery. 3. It is recommended that if results are reported below the RL, a separate standard at the MDL level analyzed after calibration is complete to check sensitivity. 4. Toxaphene requires a single point calibration. If detected in samples, the samples are re-analyzed behind a five-point calibration for each detected analyte. 5. If RSD ≤20% the average relative response factor (internal calibration) or average calibration factor (external calibration) is used for quantitation. If RSD >20% a linear regression calibration that does not pass through the origin with a correlation coefficient (r) ≥0.990 is used for quantitation; or a nonlinear first or second order calibration curve with a coefficient of determination (COD) of ≥0.990 is used for quantitation. 6. 8081B- Degradation of 4,4'-DDT/ endrin to 4,4'-DDE, 4,4'-DDD/ endrin ketone, endrin breakdown must be less than 15%.	1. Identify and correct problem. 2. Recalibrate instrument; samples should not be analyzed until initial calibration criteria are met. 3. Document any observations and corrective action in the case narrative.

Table 3-4. Pesticides using USEPA Methods 8000C/8081B quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Calibration Verification (Accuracy)	Single component analyte calibration standards must contain each target analyte at mid-range concentration. Calibration verification standards must be analyzed at the beginning of 12 hour sequence and every 20 samples (every 10 samples is recommended), and at the close of the sequence. Pesticides- A standard containing 4,4-DDT and endrin must be analyzed at the beginning of each 12 hour sequence.	Calibration verification response (% difference) or concentration (% drift) ≤ 20%. Pesticides- Degradation for 4,4-DDT and endrin must be <15%. Method 8081B- Degradation of 4,4'-DDT/ endrin to 4,4'-DDE, 4,4'-DDD/ endrin ketone, endrin breakdown must be less than 15%.	1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate; reanalyze samples back to last compliant calibration standard. Samples must be bracketed by compliant calibration standards. 3. Document any observations and corrective action in the case narrative.
Retention Time Windows (Accuracy)	Retention time windows (absolute retention time) must be established in accordance with USEPA Method 8000B/8000C or relative retention times must be used if internal standards are employed.	Compounds must be within established retention time windows or within laboratory established relative retention time criteria for the succeeding calibration standards. It is recommended that retention time windows be provided for each calibration verification. Retention times for each surrogate analyzed for samples and QC samples should be provided on a summary form.	1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate; reanalyze samples back to last compliant calibration standard. 3. Document any observations and corrective action in the case narrative.
Method Blank Analysis (Sensitivity)	Method Blank : 1 per 20 samples of similar matrix extracted at the same time and undergo same cleanup procedures as samples or a separate cleanup blank must be prepared and analyzed. Instrument blank: Must be analyzed at the beginning of 12 hour sequence, following the initial calibration verification standard.	Target analyte concentrations must be less than RL.	1. Reanalyze. 2. If limits are still exceeded, re-extract and reanalyze method blank and associated samples. Samples must not be analyzed until method blank criteria are met. 3. Document any observations and corrective action in the case narrative.

Table 3-4. Pesticides using USEPA Methods 8000C/8081B quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
	Collected per QAPP requirements.		
Field Blank Analysis **(Sensitivity)**		1. Common laboratory contaminants (phthalate) less than 5 x RL. Remaining analytes less than RL. 2. RLs and MDLS will be provided along with the blank results.	1. Investigate problem. 2. Document any observations and corrective actions in the case narrative.
Laboratory Control Sample **(Accuracy)**	Prepared with each extraction batch, of no more than 20 analytical samples. Prepared independently from calibration standards. LCSs must be spiked with each of the single component analyte at concentrations near the mid point of the calibration curve.	Percent recoveries must be within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	1. If recovery failures are above control limits and these compounds are not detected in the associated samples, no corrective action is required. 2. If recovery failures are below the control limits, reanalyze LCS and examine results of other QC analyses. 3. If other QC criteria have not been met, stop analysis, locate and correct problem, recalibrate instrument and reanalyze samples since last satisfactory LCS. 4. Document any observations and corrective action in the case narrative.
Matrix Spike/ **Matrix Spike Dup. (MS/MSD) Analysis** **(Accuracy/Precision)**	Collected per QAPP requirements. MS/MSDs must be spiked with each of the single component analyte at concentrations near the mid point of the calibration curve. Samples from the investigation must be used for MS/MSD analysis. If samples were not designated as MS/MSD samples, contact QAO upon receipt of samples at the laboratory.	Recovery and RPD within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	1. Reanalyze if <10%. 2. It is recommended that, if reanalysis is < 10%, report both analyses and document in the case narrative. 3. If reanalysis is >10%, and LCS criteria are met, document in the case narrative. 4. If LCS criteria are exceeded also, examine other QC data for source of problem; i.e. surrogate recoveries for extraction efficiency and calibration data for instrument performance issues; re-extract or reanalyze samples and associated MS/MSD and LCSs as required.

Table 3-4. Pesticides using USEPA Methods 8000C/8081B quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Surrogate Spike (Accuracy)	Samples, blanks, MS/MSDs, and LCSs must be spiked with method specified surrogate compounds on each column used in the analysis.	Recovery within laboratory control limits. Corrective action is not required if one of the four surrogates (for two columns) has recovery outside of control limits if the recovery is >10% and the remaining three surrogates are within control limits. Surrogate recoveries for each surrogate on each column must be provided in a summary form. The lowest acceptable control limits for recovery will be 10%.	1. Reanalyze. 2. If re-analysis meets criteria, report re-analysis result. 3. If reanalysis recovery fails criteria but recovery is >10%: a. Report the analysis that demonstrates fewer excursions and include raw data for both analyses in the data package. 4. If re-analysis recovery is < 10%, re-extract and re-analyze sample. 5. For re-extracted sample, report the analysis that meets criteria or demonstrates fewer excursions and include raw data for both analyses in the data package. 6. Document corrective action in the case narrative.
Field Duplicate Analysis (Precision)	Collected per QAPP requirements. Field duplicate will not be identified to the laboratory.	Validation criteria: 30% RPD for waters, 50% RPD for solids. For sample results that are less than or equal to five times the RL, the criterion of plus or minus two times the RL will be applied to evaluate field duplicates.	No corrective action required of the laboratory since the laboratory will not know the identity of the field duplicate samples. If these criteria are not met, sample results will be evaluated on a case-by-case basis.

Table 3-4. Pesticides using USEPA Methods 8000C/8081B quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Target Analyte Identification **(Accuracy)**	As required for identification of target analytes	Retention times must be within established retention time windows or must meet relative retention time criteria. Dual column confirmation (quantitative and qualitative) analysis is required. Retention time windows must be provided for each calibration verification. USEPA CLP Form 10 Summary form, providing the percent difference and retention times for all detected analytes in samples and QC samples, will be provided. Percent difference must be less than 40 %D. %D calculation: Difference between Higher concentration of sample and Lower concentration of sample divided by the Lower concentration of sample times 100.	1. Investigate problem; reanalyze calibration standards to check for retention time shift. 2. Document any observations and corrective action in the case narrative.
Screening samples	As required for samples suspected to contain high concentrations or matrix interferences	It is highly recommended that samples be screened prior to analysis. Screening data (performed prior to the initial analysis) does not need to be included in the data package. Data for samples analyzed at dilutions for initial or subsequent analyses is required to be included in the data package.	Not applicable

Table 3-4. Pesticides using USEPA Methods 8000C/8081B quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Quantitation	Samples, blanks, and QC data.	Confirmation analysis is required. Internal or external standard method may be used. Verify concentration is within linear calibration range of standards. Every effort must be made to meet specified RL requirements. Lab must state the technique used for quantitation of results for the samples.	1. If concentration is above linear calibration range, dilute sample and reanalyze. Dilution should result in concentration in the upper calibration range of the instrument. 2. Document any observations and corrective action in the case narrative.
Chromatography Presentation	For each standard, sample and QC sample analysis.	Copies of chromatograms provided in the data package must be large enough to view during validation. In the case that matrix interference is detected or manual integration is performed, enlarged copies of those manipulations will be included in the data package for review.	1. Provide requested information.
Cleanup (Where applicable)	GPC must be performed for all pesticide solids or water extracts with high molecular weight contaminants. Sulfur cleanup must be performed for all sample extracts contaminated with sulfur. Florisil cartridge cleanups should be performed for all pesticide extracts.	Calibrate according to method. Criteria must be met as listed in method.	For GPC, perform column maintenance, recalibrate. For florisil, obtain a new lot of cartridges.
Sample Batching	The laboratory will batch project samples together along with QC samples specified from the project. Non-project information will not be included in the data packages. USEPA Form 8 Summary form, providing the date, time of analysis of samples and QC samples, surrogate retention times and surrogate retention time window, should be provided.	Not applicable	Not applicable

Table 3-4. Pesticides using USEPA Methods 8000C/8081B quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Confirmation Analysis	Dual column quantitation and qualitative confirmation will be performed. The information presented in CLP Form 10 will be provided in the data package for evaluation	Not Applicable	Not Applicable
Laboratory control limits	Generated with results for an analyte from a minimum of 20 sample analyses. The average of the sample results and the standard deviation are calculated. The internal warning limits are established at 2 times the standard deviation and the control limits are established at 3 times the standard deviation. The control limits are updated annually.	Not applicable	Not applicable
Percent solids	For solids samples, the percent solids will be determined and sample results will be corrected for percent solids.	Not applicable	Not applicable
Dilutions	1. When target analyte concentration exceed upper limit of calibration curve. 2. When matrix interference demonstrated by lab and documented in the case narrative (highly viscous samples or a large number of non-target peaks on the chromatogram). . 3. Samples should be cleaned up during sample preparation/extraction procedure using appropriate methods when matrix interference is present. 4. Laboratory will note in the data deliverables which analytical runs were reported.	1. The reagent blank will meet the method blank criteria.	1. Reanalyze reagent blank until method blank criteria are met.

Table 3-4. Pesticides using USEPA Methods 8000C/8081B quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Laboratory Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Deliverables as required	1. Full NJDEP deliverables must be provided to document each audit item for easy reference and inspection. 2. It is recommended that an example calculation be provided for each analysis, for each type of matrix in the data package using samples from the project. 3. Any laboratory abbreviations or notations presented in the raw data or summary information will be explained or referenced in the case narrative. 4. Final spiking concentrations will be presented in summary form. 5. Standard tracing information will be provided. 6. Cooler temperatures will be provided in the data packages. 7. Run logs will be provided in the data packages.	Not applicable	Provide missing or additional deliverables for validation purposes.
Method and QAPP requirements	The laboratory will perform the method as presented in this QAPP and will adhere to the QAPP requirements presented herein. Otherwise the laboratory will specifically note any procedures that differ from the method or the QAPP in the data package case narrative.	Not applicable	Not applicable

Note

Data validation will be performed in accordance with QA/QC criteria established in these tables and the analytical methods that are currently used by the laboratory. Excursions from QA/QC criteria will be qualified based on guidance provided in this QAPP.

Communications with the QAO will be documented and included in the data packages.

Table 3-4B. EPH using NJDEP Method EPH 08/10 Rev 3 quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Sample preservation	Samples must be preserved based on method and QAPP requirements	For soil samples: cooler temperature ≤6°C. See Table 1 for sample preservation information.	Notify Project Manager since re-sampling may be required. Document corrective action in the case narrative.
Holding times (Sensitivity)	Samples must be extracted and analyzed within holding time.	Solids: Extract within 14 days from collection. Analyze extracts within 40 days of extraction.	If holding times are exceeded for initial or any re-analyses required due to QC excursions, notify the QAO since re-sampling may be required.

Table 3-4B. EPH using NJDEP Method EPH 08/10 Rev 3 quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Initial Calibration Initial Calibration Verification (ICV) **(Accuracy)**	Prior to start up and when criteria are exceeded for continuing calibration. 24 hour clock or a 20 sample analytical batch. Sequence begins with initial calibration standard or continuing calibration standard and ends with a closing calibration standard. FID External Standard Calibration for Quantitation of EPH. Calibrate with an initial five-point calibration with concentrations for each individual component and each surrogate for each fraction of 20 ng/uL, 100 ng/ul, 250ng/uL, 500 ng/uL and 1000 ng/uL and 100 ng/uL. The surrogate OTP and the fractionating surrogates are included in the Aromatic Hydrocarbon Standard. The surrogate COD is included in the Aliphatic Hydrocarbon Standard. A calibration factor (CF) must be established for each individual component. A separate calibration factor (CF) must be established for each carbon range of interest. Calculate CFs for the C9-C12, C12-C16, C16-C-21 and C21-C40 Aliphatic Hydrocarbon carbon ranges from the appropriate aliphatic analysis chromatogram. Calculate CFs for C10-C12, C12-C16, C16-C-21 and C21-C36 Aromatic Hydrocarbon carbon ranges from the appropriate aromatic analysis chromatogram. The areas for the surrogates must be subtracted out from the area summation of the range in which they elute. Areas associated with naphthalene and 2-methylnaphthalene in the aliphatic fraction must be subtracted out from the appropriate carbon range. Quantitation of analyses will utilize the initial calibration results.	The percent relative standard deviation (%RSD) of the calibration factors for each carbon range for the compounds and surrogates must be ≤ 25% over the working calibration range. The response ratio of C30/C20 shall be ≥ 0.8. If less than 0.8, the column should be repositioned until the mass discrimination is minimized.	1. Identify and correct problem. 2. Recalibrate instrument; samples should not be analyzed until initial calibration criteria are met. 3. Document corrective action in the case narrative.

Table 3-4B. EPH using NJDEP Method EPH 08/10 Rev 3 quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Calibration **Check Standard / Verification** **(Accuracy)**	Calibration check/verification standards must be analyzed each working day, after every 20 samples or every 24 hours (whichever is more frequent) and at the end of the analytical sequence by the injection of the mid-level calibration standards (both aliphatic and aromatic). Surrogate Standards responses and retention times in the calibration check standard must be evaluated during or immediately after data acquisition.	Calibration check/verification response for each compound, for each carbon range for each fraction- % Difference (%D) for any carbon range is ≤ 25% (≤ 30% for any single compound in a range). The area(s) for the SS changes must not change by more than ±50% from the last daily calibration standard check. The retention time of any surrogate at the beginning of the analytical shift must not fall outside of the ± 3 SD window (minimum ±0.10 min. The response ratio of C30/C20 shall be ≥ 0.8. If less than 0.8, the column should be repositioned until the mass discrimination is minimized.	1. Samples must be bracketed by compliant calibration standards. 2. Document corrective action in the case narrative.
Retention Time Windows **(Accuracy)**	Retention time windows must be established in accordance with the method. Using Aromatic Hydrocarbon and Aliphatic Hydrocarbon standard mixtures make serial injections over a 72 hr period at a minimum. Calculate the mean and the standard deviation of the three retention times (absolute retention time or relative retention time) for each individual compound. Use plus or minus three times the standard deviation of the mean retention times for each compound to define the retention time window. Use a default value of ± 0.1 minutes, if the standard deviation is close to zero.	Sample results must be within established retention time windows and the succeeding calibration standards. It is recommended that retention time windows be provided for each calibration verification. Retention times for each surrogate analyzed for samples and QC samples should also be provided on a summary form.	. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate; reanalyze samples back to last compliant calibration standard. 3. Document corrective action in the case narrative.

Table 3-4B. EPH using NJDEP Method EPH 08/10 Rev 3 quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Blank Analysis	Method Blank : Not greater than 5X MDL. If method blank concentration is greater than 5X MDL and the sample concentrations present in the samples are less than 10X the blank level, the affected samples should be re-extracted and re-analyzed. Reagent/Instrument blank: Each day before calibration and after the calibration and after high concentration samples. Peaks will not be detected above the RL within the retention time window of any carbon range of interest.	Target analyte concentrations will not be detected above the RL concentrations as appropriate and within the retention time window of any carbon range of interest.	1. Re-extract and re-analyze all associated samples. 2. Samples must not be analyzed until method and instrument blank criteria are met. 3. Document corrective action in the case narrative.
Laboratory Control Sample (LCS) Analysis/ Laboratory Control Sample Duplicate (LCSD) **(Accuracy and Precision)**	1 per 20 samples for each batch of samples extracted at the same times. Spiking Solution will contain the following: Aliphatic Hydrocarbons: n-Nonane (C9), n-Decane (C10), n-Dodecane (C12), n-Tetradecane (C14), n-Hexadecane (C16), n-Octadecane (C18), n-Eicosane (C20), n-Heneicosane (C21), n-Docosane (C22), n-Tetracosane (C24), n-Hexacosane (C26), n-Octacosane (C28), n-Triacontane (C30), n-Dotriacontane (C32), n-Tetratriacontane (C34), n-Hexatriacontane (C36), n-Octatriacontane (C38), n-Tetracontane (C40) Aromatic Hydrocarbons: Acenaphthene (C15.5), Acenaphthylene (C15.06), Anthracene (C19.43), Benzo[a]anthracene (C26.37), Benzo[a]pyrene (C31.34), Benzo[b]fluoranthene (C30.14), Benzo[g,h,i]perylene (C34.01), Benzo[k]fluoranthene (C30.14), Chrysene (C27.41), Dibenz[a,h]anthracene (C30.36), Fluoranthene (C21.85), Fluorene (C16.55), Indeno[1,2,3-cd]pyrene (C35.01), 2-Methylnaphthalene (C12.89), Naphthalene (C11.7), Phenanthrene (C19.36), Pyrene (C20.8), 1,2,3-Trimethylbenzene (C10.1)	LCS recoveries must be between 40% - 140%. n-Nonane must be greater than 25%. Each of the carbon range is also reported. LCSD recoveries must be between 40% - 140%. n-Nonane must be greater than 25%. Each of the carbon range is also reported. Precision is determined from the Relative Percent Difference (RPD) of the concentrations LCS/LCSD pair. RPDs for the aliphatic and aromatic carbon range concentrations (the sum of the individual compounds' concentrations within a carbon range) must be ≤25%. Concentration of naphthalene or 2-methyl-naphthalene must not exceed 5% of the total concentration for naphthalene or 2-methylnaphthalene in the LCS or LCS duplicate.	1, Re-extract and re-analyze all associated samples. 2. If either the concentration of naphthalene or 2-methylnaphthalene in the aliphatic fraction exceeds 5% of the total concentration for naphthalene or 2-methylnaphthalene in the LCS or LCS duplicate, then fractionation must be repeated on all stored affected sample extracts. 3. Samples must not be analyzed until LCS criteria are met. 4. Document corrective action in the case narrative.

Table 3-4B. EPH using NJDEP Method EPH 08/10 Rev 3 quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Matrix Spike/ Matrix Spike Dup. (MS/MSD) Analysis (Accuracy/Precision)	Collected per QAPP requirements. Spiking Solution will contain the following: Aliphatic Hydrocarbons: n-Nonane (C9), n-Decane (C10), n-Dodecane (C12), n-Tetradecane (C14), n-Hexadecane (C16), n-Octadecane (C18), n-Eicosane (C20), n-Heneicosane (C21), n-Docosane (C22), n-Tetracosane (C24), n-Hexacosane (C26), n-Octacosane (C28), n-Triacontane (C30), n-Dotriacontane (C32), n-Tetratriacontane (C34), n-Hexatriacontane (C36), n-Octatriacontane (C38), n-Tetracontane (C40) Aromatic Hydrocarbons: Acenaphthene (C15.5), Acenaphthylene (C15.06), Anthracene (C19.43), Benzo[a]anthracene (C26.37), Benzo[a]pyrene (C31.34), Benzo[b]fluoranthene (C30.14), Benzo[g,h,i]perylene (C34.01), Benzo[k]fluoranthene (C30.14), Chrysene (C27.41), Dibenz[a,h]anthracene (C30.36), Fluoranthene (C21.85), Fluorene (C16.55), Indeno[1,2,3-cd]pyrene (C35.01), 2-Methylnaphthalene (C12.89), Naphthalene (C11.7), Phenanthrene (C19.36), Pyrene (C20.8), 1,2,3-Trimethylbenzene (C10.1) Samples from the investigation must be used for MS/MSD analysis. If samples were not designated as MS/MSD samples, contact QAO upon receipt of samples at the laboratory.	Laboratory should establish acceptance criteria for %R. Recoveries of 40-140% should be achieved for each compound. The lowest acceptable control limits for recovery will be 10%. Laboratory should establish acceptance criteria for RPD. RPD of $\leq$50 should be achieved for each compound.	1. If LCS criteria are met, document in case narrative; no additional corrective action required. 2. If LCS criteria are exceeded also, examine other QC data for source of problem; *i.e.,* surrogate recoveries for extraction efficiency and calibration data for instrument performance issues. 3. Re-extract or reanalyze samples and associated MS/MSD and LCSs as required. 4. Document corrective action in the case narrative.
Duplicate Analysis (MS/MSD precision analysis)	Collected per QAPP requirements. Samples from the investigation must be used.	RPD within laboratory control limits. For compounds without established laboratory control limits, 5RPD will be used.	1. Document corrective action in the case narrative.

Table 3-4B. EPH using NJDEP Method EPH 08/10 Rev 3 quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Surrogates and Fractionating Surrogates **(Accuracy)**	Samples, blanks, MS/MSDs, and LCS/LCSDs must be spiked with surrogate compounds. Spike all extracts with fractionating surrogate compounds prior to the extract being separated into aliphatic and aromatic fractions.	The recovery must be within 40% - 140%.	1. Reanalyze. 2. If COD recovery is below the acceptance range and is observed in the aromatic fraction and/or OTP recovery is below the acceptance range and is observed in the aliphatic fraction, then re-fractionate the extract with the remaining 1 mL aliquot of extract and analyze the new extracts. 3. If the surrogate could not be measured because the sample was diluted prior to analysis, then qualify the surrogate recovery. Qualify the out of range surrogate on the data table. No additional corrective action is required. 4. Document corrective action in the case narrative.
Target Analyte Identification **(Accuracy)**	As required for identification of target analytes	Retention times must be within established retention time windows or must meet relative retention time criteria. It is recommended that retention time windows be provided for each calibration verification.	1. Investigate problem; reanalyze calibration standards to check for retention time shift. 2. Document corrective action in the case narrative.

Table 3-4B. EPH using NJDEP Method EPH 08/10 Rev 3 quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Quantitation	Samples, blanks, and QC data.	External standard method. Verify concentration is within linear calibration range of standards. To calculate the concentration of carbon ranges in the sample, the area response attributed to the petroleum must first be determined. This area includes all of the resolved peaks and the unresolved "envelope." This total area must be adjusted to remove area response of the solvent, surrogates and the GC column bleed. The area of the surrogates must be subtracted from their corresponding carbon range summed area. Areas for naphthalene and/or 2-methylnaphthalene in an aliphatic carbon range are subtracted from the appropriate aliphatic carbon range summed area prior to calculating the calibration factors. Every effort must be made to meet specified RL requirements. Lab must state the technique used for quantitation of results for the samples.	1. If concentration is above linear calibration range, dilute sample and reanalyze. Dilution should result in concentration in the upper calibration range of the instrument. 2. Document corrective action in the case narrative.
Field Blank Analysis **(Sensitivity)**	Collected per QAPP requirements.	Compounds concentrations must be <RL.	1. Investigate problem; reanalyze to verify laboratory cross contamination is not a factor. 2. Document in the case narrative.
Field Dup. Analysis (Precision)	Collected per QAPP requirements. Field duplicate will not be identified to the laboratory.	Validation criteria: 30% RPD for waters, 50% RPD for solids. For sample results that are less than or equal to five times the RL, the criterion of plus or minus two times the RL will be applied to evaluate field duplicates.	No corrective action required of the laboratory since the laboratory will not know the identity of the field duplicate samples. If these criteria are not met, sample results will be evaluated on a case-by-case basis.

Table 3-4B. EPH using NJDEP Method EPH 08/10 Rev 3 quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Chromatography Presentation	For each standard, sample and QC sample analysis.	Copies of chromatograms provided in the data package must be large enough to view during validation; detail of each peak involved in the Aroclor identification, including peak shape and associated baseline. In the case that matrix interference is detected or manual integration is performed, enlarged copies of those manipulations will be included in the data package for review.	1. Provide requested information.
Sample Batching	The laboratory will batch project samples together along with QC samples specified from the project. Non-project information will not be included in the data packages. USEPA Form 8 Summary form, or an equivalent form, providing the date, time of analysis of samples and QC samples, surrogate retention times and surrogate retention time window, should be provided.	Not applicable	Not applicable
Laboratory control limits	1. Generated with results for an analyte from a minimum of 20 sample analyses. The average of the sample results and the standard deviation are calculated. The internal warning limits are established at 2 times the standard deviation and the control limits are established at 3 times the standard deviation. The control limits are updated annually.	Not applicable	Not applicable
Percent solids	For solids samples, the percent solids will be determined and sample results will be corrected for percent solids.	Not applicable	Not applicable

Table 3-4B. EPH using NJDEP Method EPH 08/10 Rev 3 quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Dilutions	1. When target analyte concentration exceed upper limit of calibration curve. 2. When matrix interference demonstrated by lab and documented in the case narrative. 3. Laboratory will note in the data deliverables which analytical runs were reported.	1. The reagent blank will meet the method blank criteria.	1. Reanalyze reagent blank until method blank criteria are met.
Deliverables	1. Full NJDEP deliverables must be provided to document each audit item for easy reference and inspection. 2. It is recommended that an example calculation be provided for each analysis, for each type of matrix in the data package using samples from the project. 3. Any laboratory abbreviations or notations presented in the raw data or summary information will be explained or referenced in the case narrative. 4. Final spiking concentrations will be presented in summary form. 5. Standard tracing information will be provided. 6. Cooler temperatures will be provided in the data packages. 7. Run logs will be provided in the data packages.	Not applicable	Provide missing or additional deliverables for validation purposes.
Method and QAPP requirements	The laboratory will perform the method as presented in this QAPP and will adhere to the QAPP requirements presented herein. Otherwise the laboratory will specifically note any procedures that differ from the method or the QAPP in the data package case narrative.	Not applicable	Not applicable

Table 3-4B. EPH using NJDEP Method EPH 08/10 Rev 3 quality control requirements and corrective actions.

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action

Notes:

Data validation will be performed in accordance with QA/QC criteria established in these tables and the analytical methods that are currently used by the laboratory. Excursions from QA/QC criteria will be qualified based on guidance provided in this QAPP.

Communications with the QAO will be documented and included in the data packages.

Source: O'Brien & Gere

Table 3-5. Dioxins and Dibenzofurans by USEPA Method 8290A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Sample preservation	Samples must be preserved based on method and QAPP requirements	For aqueous and solid samples: cooler temperature ≤6°C. See Table 1 for sample preservation information.	Notify Project Manager since re-sampling may be required. Document corrective action in the case narrative.
Holding times (Sensitivity)	Samples must be extracted and analyzed within holding time.	Extract within 30 days of collection for extraction; 45 days from extraction to analysis for aqueous and solid samples. Cleanup using acid-wash, silica/alumina silica gel and carbon as described in Method 8290A Section 11.5.	If holding times are exceeded for initial or any reanalyses required due to QC excursions, notify QAO since re-sampling may be required.
MS Performance (Accuracy)	Operating in EI/SIM mode with a total cycle time of one second or less.. At the beginning and end of the 12 hour sequence. Prior to calibration, blank, sample and QC sample analysis.	Tune instrument using PFK in accordance with Section 11.6.2 and Table 6 in Method 8290A. Minimally, the mass spectrometer must have a resolving power of at least 10,000 (10% valley) at 304.9824 or any other signal close to m/z 303.9016 (TCDF). Verify PFK the exact mass of m/z 380.9760 is within 5 ppm of the required value. The resolving power values and peak profiles will be provided n the data package for each mass measured for evaluation as described in Method 8290A. Note that the selection of the low- and high-mass ions must be such that they provide the largest voltage jump performed in any of the five mass descriptors (Table 6). Document instrument resolving power by recording the peak profile of the high-mass reference signal (m/z 380.9760) obtained during the above peak matching experiment by using the low mass PFK ion at m/z 304.9824 as a reference. The minimum resolving power of 10,000 must be demonstrated on the high-mass ion while it is transmitted at a lower accelerating voltage than the low-mass reference ion, which is transmitted at full sensitivity. The format of the peak profile representation (Figure 5 Method 8290A) must allow manual determination of the resolution, i.e., the horizontal axis must be a calibrated mass scale (amu or ppm per division). The result of the peak width measurement (performed at 5 percent of the maximum, which corresponds to the 10 percent valley definition) must appear on the hard copy and cannot exceed 100 ppm at m/z 380.9760 (or 0.038 amu at that particular mass).	1. Identify and correct problem. 2. Re-tune the mass spectrometer; samples must not be analyzed until tuning criteria are met. 3. Document any observation or corrective action in the case narrative

Table 3-5. Dioxins and Dibenzofurans by USEPA Method 8290A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
		Must contain the first and last for each homologous series tetra- through heptachlorinated congeners. It also contains other TCDD isomers and $^{13}C_{12}$-2,3,7,8-TCDD to document resolution (refer to Table 7 of Method 8290A).	
		Method 8290A Section 9.3.1 must be met.	
		Chromatographic resolution between 2378-TCDD and the peaks representing any other unlabeled TCDD isomers must be resolved with a valley $\leq$25%.	
GC Column Performance (Window defining mixture)	At the beginning of 12 hour sequence, prior to initial calibration or continuing calibration standard.	GC column performance standard is also used to determine the retention times for quantitative determination of the non -2378-substituted congeners.	1. Identify and correct problems
		Data presentation - All congener peaks will be labeled and identified on the Selected Ion Current Profiles (SICPs) along with retention times (RTs). Additionally, first eluters must be labeled with the letter F, and the last eluters with the letter L.	2. Reanalyze; samples must not be analyzed until GC column performance check criteria are established. 3. Document any observation or corrective action in the case narrative
		Switching of SIM ions from one homologous series to the next higher must be indicated in the SICP. Allowable tolerance on the daily verification with the GC performance check should be better than 10 sec for the absolute retention times of all the components of the mixture. The switching time between the last TCDD congener (i.e., 1,2,8,9-TCDD) and the first PeCDF congener (i.e., 1,3,4,6,8-PeCDF), should be noted as these two Target analytes elute within 15 sec of each other.	

Table 3-5. Dioxins and Dibenzofurans by USEPA Method 8290A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Selective Ion Monitoring (SIM) Descriptors and Lock Masses	Acquire SIM data for all ions listed in the five descriptors. Monitor Lock Masses. Data presentation - **SICPS must be clearly labeled with congener names and RTs.**	The ions listed in Method 8290A, Table 6 must be monitored. The tetra and penta chlorinated dioxins and furans can be combined. All congener peaks will be labeled and identified on the SICPs along with RTs. Note that with the exception of the last descriptor (OCDD/OCDF), all descriptors contain 10 ions. The selection (Table 6) of the molecular ions M and M+2 for 13C-HxCDF and 13C-HpCDF rather than M+2 and M+4 (for consistency) was made to eliminate, even under high-resolution mass spectrometric conditions, interferences occurring in these two ion channels for samples containing high levels of native HxCDDs and HpCDDs. It is important to maintain the same set of ions for both calibration and sample extract analyses. To monitor long term mass stability, a lock-mass ion from PFK is selected based on the masses of the ions monitored within each descriptor. Table 6 offers some suggestions; an acceptable lock-mass ion at any mass between the lightest and heaviest ion in each descriptor can be used to monitor and correct mass drifts. The level of the reference compound (PFK) metered into the ion chamber during HRGC/HRMS analyses should be adjusted so that the amplitude of the most intense selected lock-mass ion signal (regardless of the descriptor number) does not exceed 10 percent of the full scale deflection for a given set of detector parameters. Under those conditions, sensitivity changes that might occur during the analysis can be more effectively monitored.	1. Identify and correct problems. 2. Document any observation or corrective action in the case narrative

Table 3-5. Dioxins and Dibenzofurans by USEPA Method 8290A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
	Before any samples are analyzed, when criteria are exceeded for continuing calibration, and if calibration, sample fortification (internal standard) or recovery standard solutions are replaced with a different lot.	Minimally five concentrations, using the calibration range specified in Table 5 of EPA Method 8290A. The ratio of integrated ion current for the ions appearing in Table 8 (homologous series quantitation ions) must be within the indicated control limits (set for each homologous series) for all unlabeled calibration standards in Table 5.	
Initial Calibration **Accuracy)**	Calibration standard consists of 17 unlabeled target Target analytes spiked with the 5 labeled internals, and 2 labeled recovery standards. Additionally, 7 labeled PCDDs/PCDFs may be used by the laboratory as surrogate and alternative standards. Apply standard concentrations listed in 8290A Table 5 and list concentrations in the case narrative.	The ratio of integrated ion current for the ions belonging to the carbon-labeled internal and recovery standards specified in EPA method 8290A Table 8 must be met. For each SICP and for each GC signal corresponding to the elution of a target analyte and of its labeled standards, the signal-to-noise ratio (S/N) must be better than or equal to 10. Measurement of S/N is required for any GC peak that has an apparent S/N of less than 5:1. The result of the calculation must appear on the SICP above the GC peak in question. The calibration solutions do not contain 13C12-OCDF as an internal standard. RSD $\leq$20% for the 17 unlabeled PCDDs/PCDFs relative to the internal standard and $\leq$20% for the nine labeled internal standards relative to the recovery standards.	1. Identify and correct problem. 2. Recalibrate instrument; samples must not be analyzed until initial calibration criteria are met. 3. Document any observation or corrective action in the case narrative
	All congener peaks will be labeled and identified on the SICPs along with RTs.	If the criterion is met, the mean RFs will be used for all calculations until the routine calibration criteria (Sec. 11.7.4) are no longer met. At such time, new values will be calculated from a new set of injections of the calibration solutions.	

Table 3-5. Dioxins and Dibenzofurans by USEPA Method 8290A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
		Relative ion abundance criteria specified in EPA method 8290A Table 8 must be met.	
Continuing Calibration Verification (CCV)	high-resolution concentration calibration solution No. 3 (HRCC-3; see Table 5 Method 8290A)	The RFs must be within 20% of the mean values from the IC for the 17 unlabeled standards and must be within 30% for the nine labeled standards from the IC.	1. Reanalyze.
(Accuracy)	Analyze at beginning of the 12-hour sequence following the GC performance check standard and at the end of the 12-hour sequence.	If the continuing calibration check performed at the end of a 12 hr period fails by no more than 25 percent RPD for the 17 unlabeled Target analytes and 35 percent RPD for the 9 labeled reference Target analytes, use the mean to the two "daily" RF values from the two daily routine calibration runs to compute the analyte concentrations, instead of the R&F & values obtained from the initial calibration. A new initial calibration (new R&F &s) is required immediately (within 2 hr) following the analysis of the samples, whenever the RPD from the end-of-shift routine calibration exceeds 25 percent or 35 percent, respectively. Failure to perform a new initial calibration immediately following the analysis of the samples will automatically require reanalysis of all positive sample extracts analyzed before the failed end-of-shift continuing calibration check.	2. If criteria are still not met, identify and correct problem, recalibrate; samples cannot be analyzed until continuing calibration criteria are met. 3. Document any observation or corrective action in the case narrative
Internal Standards	Samples, blanks, MS/MSDs, LCSs are spiked with labeled internal standards prior to extraction as listed in Method 8290A.	Percent recoveries must be within 40% to 135% for all 2,3,7,8-substituted internal standards.	1. Re-extract and/or re-analyze.
(Accuracy)		HPCDD, HPCDF, and OCDD percent recoveries must be within 25 to 130%.	2. If re-extraction and re-analysis does not solve problem and other QC criteria were met, submit both runs and discuss in narrative report.
		Ion abundance criteria specified in EPA Method 8290A must be met.	3. Document any observation or corrective action in the case narrative
Surrogate or Alternate Standards	Samples, blanks, and MS/MSDs are spiked with seven labeled standards after extraction and prior to cleanup.	Percent recoveries must be within 40% to 130% for the tetra through hexachlorinated surrogates and 25% to 130% fro the heptachlorinated surrogates.	1. Re-extract and/or re-analyze.
(Accuracy)			2. If re-extraction and re-analysis does not solve problem and other QC criteria were met, submit both runs and discuss in narrative report
			3. Document any observation or corrective action in the case narrative

Table 3-5. Dioxins and Dibenzofurans by USEPA Method 8290A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Recovery Standard **(Accuracy)**	Consists of 13C12 1,2,3,4-TCDD and 13C12 1,2,3,7,8,9-HxCDD which are added to field samples, blanks, QC samples prior to sample injection.	Recovery standard are used to calculate internal standard recovery. Recovery standards are evaluated during data validation for recovery and retention time as compared to associated CCV area and RT. Laboratory will report the areas and retention times of the recovery standards for each CCV, sample, blank and QC analysis in a summary form.	Not applicable
Method Blank Analysis **(Sensitivity)**	One for every 20 samples of similar matrix extracted at the same time and treated in the same manner as the samples, analyzed between the calibration standard and samples.	Compound concentrations must be <RL.	1. Reanalyze. 2. If limits are still exceeded, re-extract and reanalyze method blank and associated samples if holding times have not elapsed. 3. Document any observation or corrective action in the case narrative
MS/MSD Analysis **(Accuracy and Precision)**	One for each matrix type and every 20 samples of similar matrix. MS/MSDs must be spiked with Target analytes specified in the Method 8290, Table 5.	Recovery within laboratory limits. RPD within 20%.	1. Reanalyze. 2. If recovery or RPD is still outside limits, document in case narrative report. 3. Document any observation or corrective action in the case narrative
Duplicate Analysis **(Precision)**	One for every sample batch.	RPD within 20%.	1. Reanalyze. 2. If RPD is still outside limits, document in case narrative report. 3. Document any observation or corrective action in the case narrative

Table 3-5. Dioxins and Dibenzofurans by USEPA Method 8290A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
		Acquire SIM data using the same acquisition and mass spectrometer operating condition. Ions characteristic of polychlorinated diphenyl ethers are included in the descriptors listed in Table 6. SICP for the lock-mass ions (one per mass descriptor) must also be recorded and included in the data package. These SICPs must be true representations of the evolution of the lock-mass ions amplitudes during the HRGC/HRMS run for the proper level of reference compound to be metered into the ion chamber). For 2,3,7,8-substituted congeners, which have an isotopically-labeled internal or recovery standard present in the sample extract (this represents a total of 10 congeners including OCDD; Tables 2 and 3), the retention time (RRT; at maximum peak height) of the sample components (i.e., the two ions used for quantitation purposes listed in Table 6) must be within -1 to +3 sec of the isotopically-labeled standard.	
Sample analysis and **Identification**	Samples, blanks, and QC data.	For 2,3,7,8-substituted Target analytes that do not have an isotopically-labeled internal standard present in the sample extract (this represents a total of six congeners; Table 3), the retention time must fall within 0.005 retention time units of the relative retention times measured in the routine calibration. Identification of OCDF is based on its retention time relative to 13C12-OCDD as determined from the daily routine calibration results. For non-2,3,7,8-substituted Target analytes (tetra through octa; totaling 119 congeners), the retention time must be within the corresponding homologous retention time windows established by analyzing the column performance check solution (Sec. 9.6.2). The ion current response for both ions must reach a maximum with ±2 seconds. The ion current responses for both ions used for quantitative purposes must reach maximum simultaneously (± 2 sec). The ion current responses for both ions used for the labeled standards must reach maximum simultaneously (± 2 sec). The analyst is required to verify the presence of 1,2,8,9-TCDD and 1,3,4,6,8-PeCDF in the SICPs of the daily performance checks. Ion abundance rations specified in Method 8290A Table 8 must be met. All ion current intensities must be # 2.5 times noise level for positive identification of an unlabeled PCDD/PCDF compound or a group of coeluting isomers. Labeled analytes must have an S/N > 10. The RRT of the 2,3,7,8-substituted congeners for which no carbon-labeled analogues are available must fall within 0.006 units of the carbon-labeled standard RRT.	1. If identification criteria are not all met, but in the judgment of the operator the target compound is present, proceed with quantitation and document reasoning in the data package. 2. Document any observation or corrective action in the case narrative

Table 3-5. Dioxins and Dibenzofurans by USEPA Method 8290A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Identification Interference	Samples, blanks, and QC data.	The identification of PCDFs is made only if no S/N ☐2.5 is detected at the same retention time (±2 seconds) in the corresponding polychlorinated diphenyl ether channel. Internal and external standard method. The relative response factors to be used for the determination of the concentration of total isomers in a homologous series are calculated as follows: 1- For congeners that belong to a homologous series containing only one isomer (or only one 2,3,7,8-substituted isomer the Ave RF used will be the same as determined in Sec. 11.7.1.4.5. 2 - For congeners that belong to a homologous series containing more than one 2,3,7,8-substituted isomer (Table 4), the Ave RF used for those homologous series will be the mean of the RFs calculated for all individual 2,3,7,8-substituted congeners using the equation in 11.7.1.4.6. If the analyte is identified as one of the 2,3,7,8-substituted PCDDs or PCDFs, Ave RF is the value calculated using the equation in Sec. 11.7.1.4.5. For non- 2,3,7,8-substituted congener, the Ave RF value is the one calculated using the equation in Sec. 11.7.1.4.6 (RFk, for k = 27 to 30).	Identify problem and correct.
Quantitation	Samples, blanks, and QC data.	If the concentration in the final extract of any of the fifteen 2,3,7,8- substituted PCDD/PCDF Target analytes (Table 3) exceeds the upper method calibration limits (MCL) listed in Table 1 the linear range of response versus concentration may have been exceeded, and a second analysis of the sample should be undertaken. The volumes of the internal and recovery standard solutions should remain the same as described for the sample preparation (Secs. 11.0). The total concentration for each homologous series of PCDD and PCDF is calculated by summing up the concentrations of all positively identified isomers of each homologous series. Soil and sediment samples concentrations must be corrected to dry weight. The concentration of the 2,3,7,8-TCDF is obtained from the analysis of the sample extract on the 30-m DB-225.. The chromatographic separation between the 2,3,7,8-TCDF and its close eluters (2,3,4,7-TCDF and 1,2,3,9-TCDF) must be equal or less than 25 percent valley. May use SP-2330 GC column instead of the DB-5 column. provided the criteria listed in Sec. 9.3.1 are met and the requirements described in Sec. 9.6.2 are followed.	1. If peak is saturated, dilute sample and reanalyze. 2. If 2,3,7,8-substituted PCDD/PCDF concentration is greater than the calibration limit, a second analysis using dilution is performed (see Method 8290A, Section 11.9) 3. Perform appropriate cleanup procedures as necessary to minimize sample matrix effects. 4. Document any observation or corrective action in the case narrative

Table 3-5. Dioxins and Dibenzofurans by USEPA Method 8290A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Sample Specific Estimated Quantitation Limit (ERL)	Sample specific ERL is the concentration of a target analyte required to produce a signal with a peak height of at least 2.5 times the background signal.	Calculate an EDL for each 2,3,7,8-substituted congener that is not identified. See Section 11.9.5.1: 1- Samples giving a response for both quantitation ions (Tables 6 and 9) that is less than 2.5 times the background level - Calculate EDL for each 2,3,7,8- substituted PCDD/PCDF that does not have a response with S/N ≥ 2.5. The background level is determined by measuring the range of the noise (peak to peak) for the two quantitation ions (Table 6) of a particular 2,3,7,8-substituted isomer within an homologous series, in the region of the SICP trace corresponding to the elution of the internal standard (if the congener possesses an internal standard) or in the region of the SICP where the congener is expected to elute by comparison with the routine calibration data (for those congeners that do not have a 13C-labeled standard), multiplying that noise height by 2.5, and relating the product to an estimated concentration that would produce that peak height.	**Data presentation - Data must be provided so that an ERL can be independently calculated using data presented in the data package for each applicable sample result.** **Provide an example calculation in the case narrative demonstrating one ERL calculation from the project results; identify all data sources used in the calculation in the data package case narrative.**
Estimated Maximum Possible Concentration (EMPC)	EMPCs will be reported for all samples, blanks, QC data, where applicable.	EMPC is calculated for 2,3,7,8-substituted isomers that are characterized by a response with an S/N of at least 2.5 for both the quantitation ions, and meet all of the identification criteria in Sec. 11.8.4 except the ion abundance ratio criteria or when a peak representing a PCDPE has been detected. An EMPC is a worst-case estimate of the concentration. Calculate the EMPC according to the expression shown in Sec. 11.9.1. Provide an example calculation in the case narrative demonstrating one EMPC calculation from the project results; identify all data sources used in the calculation in the data package case narrative.	**Data presentation - Data must be provided so that an EMPC can be independently calculated using data presented in the data package for each applicable sample result.**
Field / Equipment Blank Analysis **(Sensitivity)**	Field collected as per QAPP	Target analytes concentrations must be <RL.	Investigate problem; reanalyze to verify laboratory cross contamination is not a factor.

Table 3-5. Dioxins and Dibenzofurans by USEPA Method 8290A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Field Duplicate Analysis (Precision)	Field collected as per QAPP	Validation criteria: 30% RPD for waters, 50% RPD for solids. For sample results that are less than or equal to five times the RL, the criterion of plus or minus two times the RL will be applied to evaluate field duplicates.	No corrective action required of the laboratory since the laboratory will not know the identity of the field duplicate samples. If these criteria are not met, sample results will be evaluated on a case-by-case basis during the validation process.
Percent solids	For solid samples, the percent solids will be determined and sample results will be corrected for percent solids.	Not applicable	Not applicable
Toxicity Equivalents (TEs)	As requested	The 2,3,7,8-TCDD toxicity equivalents (TE) of PCDDs and PCDFs present in the sample are calculated, if requested by the data user, according to the method recommended by the Chlorinated Dioxins Workgroup (CDWG) of the EPA and the Center for Disease Control (CDC). This method assigns a 2,3,7,8-TCDD toxicity equivalency factor (TEF) to each of the fifteen 2,3,7,8-substituted PCDDs and PCDFs (Table 3) and to OCDD and OCDF, as shown in Table 10. The 2,3,7,8-TCDD equivalent of the PCDDs and PCDFs present in the sample is calculated by summing the TEF times their concentration for each of the Target analytes or groups of Target analytes listed in Table 10.	Not applicable

Table 3-5. Dioxins and Dibenzofurans by USEPA Method 8290A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Laboratory Control Limits	Laboratory Corrective Action
Deliverables where required	The laboratory data package must provide summary forms and supportive documentation for each audit parameter with applicable control limits presented in summary form..	For data presentation, SICPS must be clearly labeled with congener names and RTs. Full NJDEP deliverables must be provided to document each audit item for easy reference and inspection. Example calculations (as described in this table) will be provided for each analysis, for each type of matrix in the data package using samples from the project. IMPORTANT- Any laboratory abbreviations or notations presented in the raw data or summary information will be explained or referenced in the case narrative. Final spiking concentrations (on-column concentration units) for calibrations, spikes, internal standards, recovery standards, any other spikes used be presented in summary form. Standard tracing information will be provided for one data package. Cooler temperatures will be provided in the data packages. Run logs with all lab notations clearly explained will be provided in the data packages.	**Data presentation - Data must be provided for both 1- and 2- types of sample result calculation, as described in the quantitation parameter in this table, can be performed independently using data presented in the data package for each applicable sample result.** **Provide an example calculation in the case narrative demonstrating each of the 2 types of sample result calculations from the project results; identify all data sources used in the calculations in the data package case narrative.**
Method and QAPP requirements	The laboratory will perform the method and will adhere to the QAPP requirements presented herein. Otherwise the laboratory will specifically note any procedures that differ from the method or the QAPP in the data package case narrative.	Not applicable	Not applicable

Note

Data validation will be performed in accordance with QA/QC criteria established in these tables and the analytical methods that are currently used by the laboratory. Excursions from QA/QC criteria will be qualified based on guidance provided in this QAPP.

Communications with the QAO will be documented and included in the data packages.

Source: O'Brien & Gere

Table 3-6. Explosives using USEPA Methods 8330A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Sample preservation	Samples must be preserved based on method and QAPP requirements	For aqueous and solid samples: cooler temperature ≤6°C. See Table 1 for sample preservation information.	Notify Project Manager since re-sampling may be required. Document corrective action in the case narrative.
Holding times (Sensitivity)	Samples must be extracted and analyzed within holding time.	Extract within 7 days from collection for aqueous samples; 14 days for soil samples. Analyze extracts within 40 days of extraction.	If holding times are exceeded for initial or any re-analyses required due to QC excursions, notify the QAO since re-sampling may be required.
Initial Calibration **High Performance Liquid Chromatography (HPLC)** **(Accuracy)**	Prior to start up and when criteria are exceeded for continuing calibration. Calibrations must contain all target analytes. Quantitation of analyses will utilize the initial calibration results.	1. Minimally five concentrations for each target analyte. One calibration standard must be at concentration less than or equal to the RL. 2. It is recommended that if results are reported below the RL, a separate standard at the MDL level analyzed after calibration is complete to check sensitivity. 3. If RSD ≤20% the average relative response factor (internal calibration) or average calibration factor (external calibration) is used for quantitation. If RSD >20% a linear regression calibration that does not pass through the origin with a correlation coefficient (r) ≥0.990 is used for quantitation; or a nonlinear first or second order calibration curve with a coefficient of determination (COD) of ≥0.990 is used for quantitation.	1. Identify and correct problem. 2. Recalibrate instrument; samples should not be analyzed until initial calibration criteria are met. 3. Document any observations and corrective action in the case narrative.

Table 3-6. Explosives using USEPA Methods 8330A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Initial Calibration Verification (ICV) **Continuing Calibration Verification (CCV)** **(Accuracy)**	ICV analyzed after the IC. CCVs must contain each target analyte at mid-range concentration. CCVs must be analyzed at the beginning of 12 hour sequence and every 20 samples (every 10 samples is recommended), and at the close of the sequence.	ICV/CCV ≤ 20%.	1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate; reanalyze samples back to last compliant calibration standard. Samples must be bracketed by compliant calibration standards. 3. Document any observations and corrective action in the case narrative.
Retention Time Windows	Retention time windows (absolute retention time) must be established in accordance with USEPA Method 8000B/8000C or relative retention times must be used if internal standards are employed.	Compounds must be within established retention time windows or within laboratory established relative retention time criteria for the succeeding calibration standards. Retention time windows must be provided for each calibration verification. Retention times for each surrogate analyzed for samples and QC samples must be provided on a summary form.	1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate; reanalyze samples back to last compliant calibration standard. 3. Document any observations and corrective action in the case narrative.
Method Blank Analysis **(Sensitivity)**	Method Blank : 1 per 20 samples of similar matrix e	Less than RL.	1. Reanalyze. 2. If limits are still exceeded, re-extract and reanalyze method blank and associated samples. Samples must not be analyzed until method blank criteria are met. 3. Document any observations and corrective action in the case narrative.

Table 3-6. Explosives using USEPA Methods 8330A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Laboratory Control Sample (Accuracy)	1 per 20 samples of similar matrix extracted at the same times. LCSs should be spiked with each of the single component analyte at concentrations near the midpoint of the calibration curve.	Percent recoveries must be within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	1. Reanalyze and examine results of other QC analyses. 2. If the percent recovery is above laboratory control limits and the affected compound is not detected in the associated samples, corrective action is not required; document in case narrative. 3. If percent recovery is below laboratory control limits or <10%, reanalyze LCS. If recoveries remain below limits and other QC criteria have been met, report both analyses and document in case narrative report. 4. If recoveries are below laboratory control limits and additional QC excursions are observed, locate and correct problem, recalibrate instrument and re-extract and/or re-analyze samples since last satisfactory LCS. 5. Document any observations and corrective action in the case narrative.

Table 3-6. Explosives using USEPA Methods 8330A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
MS/MSD Analysis **(Accuracy and Precision)**	1 per 20 samples of similar matrix extracted at the same times. MS/MSDs must be spiked with each of the single component analyte at concentrations near the midpoint of the calibration curve. Samples from the investigation must be used for MS/MSD analysis. If samples were not designated as MS/MSD samples, contact QAO upon receipt of samples at the laboratory.	Recovery and RPD within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	1. Reanalyze if <10%. 2. If reanalysis is still <10%, report both analyses and document in the case narrative. 3. If re-analysis is >10% and LCS criteria are met, document in case narrative; no additional corrective action required. 4. If LCS criteria are exceeded also, examine other QC data for source of problem; *i.e.*, surrogate recoveries for extraction efficiency and calibration data for instrument performance issues. 5. Re-extract or reanalyze samples and associated MS/MSD and LCSs as required. 6. Document any observations and corrective action in the case narrative.

Table 3-6. Explosives using USEPA Methods 8330A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Surrogate Spike (Accuracy)	Samples, blanks, MS/MSDs, and LCSs must be spiked with method specified surrogate compounds on each column used in the analysis.	Recovery within laboratory control limits. Corrective action is not required if one of the two surrogates (for two columns) has recovery outside of control limits if the recovery is >10% and the remaining surrogate is within control limits. Surrogate recoveries for each surrogate on each column must be provided in a summary form. The lowest acceptable control limits for recovery will be 10%.	1. Reanalyze. 2. If reanalysis recovery fails criteria but is >10%, report both analyses and document in case narrative report. 3. If reanalysis recovery is <10%, re-extract and reanalyze the sample. Special Circumstances. If matrix interference is present (as documented in the case narrative): 1. Reanalyze sample; may be at a higher dilution. 2. Report both analyses. Document any observations and corrective action in the case narrative.

Table 3-6. Explosives using USEPA Methods 8330A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Identification	Samples, blanks, and QC data.	Retention times must be within established retention time windows or must meet relative retention time criteria. Dual column confirmation (quantitative and qualitative) analysis is required. Retention time windows must be provided for each calibration verification. USEPA CLP Form 10 Summary form, providing the percent difference and retention times for all detected analytes in samples and QC samples, will be provided. Percent difference must be less than 40 %D. %D calculation: Difference between Higher concentration of sample and Lower concentration of sample divided by the Lower concentration of sample times 100.	1. Investigate problem; reanalyze calibration standards to check for retention time shift. 2. Document any observations and corrective action in the case narrative.

Table 3-6. Explosives using USEPA Methods 8330A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Quantitation	Samples, blanks, and QC data.	Confirmation analysis is required. Internal or external standard method may be used. Verify concentration is within linear calibration range of standards. Every effort must be made to meet specified RL requirements. Lab must state the technique used for quantitation of results for the samples.	1. If concentration is above linear calibration range, dilute sample and reanalyze. Dilution should result in concentration in the upper calibration range of the instrument. 2. Document any observations and corrective action in the case narrative.
Field Blank Analysis (Sensitivity)	As per QAPP	Less than RL.	1. Investigate problem; reanalyze to verify laboratory cross contamination is not a factor. 2. Document any observations and in the case narrative.
Field Duplicate Analysis (Precision)	As per QAPP	Validation criteria: 30% RPD for waters, 50% RPD for solids. For sample results that are less than or equal to five times the RL, the criterion of plus or minus two times the RL will be applied to evaluate field duplicates.	No corrective action required of the laboratory since the laboratory will not know the identity of the field duplicate samples. If these criteria are not met, sample results will be evaluated on a case-by-case basis during the validation process.
Chromatography Presentation	For each standard, sample and QC sample analysis.	Copies of chromatograms provided in the data package must be large enough to view during validation. In the case that matrix interference is detected or manual integration is performed, enlarged copies of those manipulations will be included in the data package for review.	1. Provide requested information.

Table 3-6. Explosives using USEPA Methods 8330A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Sample Batching	The laboratory will batch project samples together along with QC samples specified from the project. Non-project information will not be included in the data packages.	Not applicable	Not applicable
Confirmation Analysis	USEPA Form 8 Summary form, providing the date, time of analysis of samples and QC samples, surrogate retention times and surrogate retention time window, will be provided. Dual column quantitation and qualitative confirmation will be performed. The information presented in CLP Form 10 will be provided in the data package for evaluation.	Not Applicable	Not Applicable
Laboratory control limits	Generated with results for an analyte from a minimum of 20 sample analyses. The average of the sample results and the standard deviation are calculated. The internal warning limits are established at 2 times the standard deviation and the control limits are established at 3 times the standard deviation. The control limits are updated annually.	Not applicable	Not applicable
Percent solids	For solids samples, the percent solids will be determined and sample results will be corrected for percent solids.	Not applicable	Not applicable

Table 3-6. Explosives using USEPA Methods 8330A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Dilutions	1. When target analyte concentration exceed upper limit of calibration curve. 2. When matrix interference demonstrated by lab and documented in the case narrative (highly viscous samples or a large number of non-target peaks on the chromatogram). . 3. Laboratory will note in the data deliverables which analytical runs were reported.	1. The reagent blank will meet the method blank criteria.	1. Reanalyze reagent blank until method blank criteria are met.
Deliverables as required	1. Full NJDEP deliverables must be provided to document each audit item for easy reference and inspection. 2. An example calculation will be provided for each analysis, for each type of matrix in the data package using samples from the project. 3. Any laboratory abbreviations or notations presented in the raw data or summary information will be explained or referenced in the case narrative. 4. Final spiking concentrations will be presented in summary form. 5. Standard tracing information will be provided. 6. Cooler temperatures will be provided in the data packages. 7. Run logs with laboratory notations clearly defined will be provided in the data packages.	Not applicable	Provide missing or additional deliverables for validation purposes.

Table 3-6. Explosives using USEPA Methods 8330A quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Method and QAPP requirements	The laboratory will perform the method as presented in this QAPP and will adhere to the QAPP requirements presented herein. Otherwise the laboratory will specifically note any procedures that differ from the method or the QAPP in the data package case narrative.	Not applicable	Not applicable

Note

Data validation will be performed in accordance with QA/QC criteria established in these tables and the analytical methods that are currently used by the laboratory. Excursions from QA/QC criteria will be qualified based on guidance provided in this QAPP.

Communications with the QAO will be documented and included in the data packages.

Source: O'Brien & Gere

Table 3-7. Explosives using USEPA Method 8095 quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Sample preservation	Samples must be preserved based on method and QAPP requirements	For aqueous and solid samples: cooler temperature ≤6°C. See Table 1 for sample preservation information.	Notify Project Manager since re-sampling may be required. Document corrective action in the case narrative.
Holding times (Sensitivity)	Samples must be extracted and analyzed within holding time.	Extract within 7 days from collection for aqueous samples; 14 days for soil samples. Analyze extracts within 40 days of extraction.	If holding times are exceeded for initial or any re-analyses required due to QC excursions, notify the QAO since re-sampling may be required.
Initial Calibration **Gas Chromatography (GC)** **(Accuracy)**	Prior to start up and when criteria are exceeded for continuing calibration. Calibrations must contain all target analytes. Quantitation of analyses will utilize the initial calibration results.	1. Minimally five concentrations for each target analyte. One calibration standard must be at concentration less than or equal to the RL. 2. It is recommended that if results are reported below the RL, a separate standard at the MDL level analyzed after calibration is complete to check sensitivity. 3. Using power regression, correlation coefficient should be (r) ≥0.990.	1. Identify and correct problem. 2. Recalibrate instrument; samples should not be analyzed until initial calibration criteria are met. 3. Document any observations and corrective action in the case narrative.

Table 3-7. Explosives using USEPA Method 8095 quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Calibration Verification (Accuracy)	Calibration standards must contain each target analyte at mid-range concentration. Calibration verification standards must be analyzed at the beginning of after every 10 to 20 samples.	Calibration verification response (% difference) or concentration (% drift) ≤ 20%. The target compounds are known to decompose if the injection port of the GC becomes activated/contaminated due to dirty samples. Therefore, when a calibration verification standard fails, the analyst must evaluate whether the calibration has drifted out of the acceptable range due to normal calibration drift or active sites in the injection port causing degradation of the target compounds. Degradation of the target compounds would be expected to lead to lower responses.	1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate; reanalyze samples back to last compliant calibration standard. Samples must be bracketed by compliant calibration standards. 3. Document any observations and corrective action in the case narrative.
Retention Time Windows	Retention time windows established from standard curve. Retention time windows established as ±0.06 minutes.	Compounds must be within established retention time windows or within laboratory established relative retention time criteria for the succeeding calibration standards. Retention time windows must be provided for each calibration verification. Retention times for each surrogate analyzed for samples and QC samples must be provided on a summary form.	1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate; reanalyze samples back to last compliant calibration standard. 3. Document any observations and corrective action in the case narrative.
Method Blank Analysis (Sensitivity)	Method Blank: 1 per 20 samples of similar matrix.	Less than RL.	1. Reanalyze. 2. If limits are still exceeded, re-extract and reanalyze method blank and associated samples. Samples must not be analyzed until method blank criteria are met. 3. Document any observations and corrective action in the case narrative.

Table 3-7. Explosives using USEPA Method 8095 quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Laboratory Control Sample **(Accuracy)**	1 per 20 samples of similar matrix extracted at the same times. LCSs should be spiked with each of the single component analyte at concentrations near the low end of the calibration curve.For soil samples, spike at 4X low standard. For waters, spike at 40X low standard.	Percent recoveries must be within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	1. Reanalyze and examine results of other QC analyses. 2. If the percent recovery is above laboratory control limits and the affected compound is not detected in the associated samples, corrective action is not required; document in case narrative. 3. If percent recovery is below laboratory control limits or <10%, reanalyze LCS. If recoveries remain below limits and other QC criteria have been met, report both analyses and document in case narrative report. 4. If recoveries are below laboratory control limits and additional QC excursions are observed, locate and correct problem, recalibrate instrument and re-extract and/or re-analyze samples since last satisfactory LCS. 5. Document any observations and corrective action in the case narrative.
MS/MSD Analysis **(Accuracy and Precision)**	1 per 20 samples of similar matrix extracted at the same times. MS/MSDs must be spiked with each of the single component analyte at concentrations near the low end of the calibration curve as previously described. Samples from the investigation must be used for MS/MSD analysis. If samples were not designated as MS/MSD samples, contact QAO upon receipt of samples at the laboratory.	Recovery and RPD within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	1. Reanalyze if <10%. 2. If reanalysis is still <10%, report both analyses and document in the case narrative. 3. If re-analysis is >10% and LCS criteria are met, document in case narrative; no additional corrective action required. 4. If LCS criteria are exceeded also, examine other QC data for source of problem; *i.e.,* surrogate recoveries for extraction efficiency and calibration data for instrument performance issues. 5. Re-extract or reanalyze samples and associated MS/MSD and LCSs as required. 6. Document any observations and corrective action in the case narrative.

Table 3-7. Explosives using USEPA Method 8095 quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Surrogate Spike **(Accuracy)**	Samples, blanks, MS/MSDs, and LCSs must be spiked with method specified surrogate compounds on each column used in the analysis.	Recovery within laboratory control limits. Surrogate recoveries for the surrogate on each column must be provided in a summary form. The lowest acceptable control limits for recovery will be 10%.	1. Reanalyze. 2. If reanalysis recovery fails criteria but is >10%, report both analyses and document in case narrative report. 3. If reanalysis recovery is <10%, re-extract and reanalyze the sample. Special Circumstances. If matrix interference is present (as documented in the case narrative): 1. Reanalyze sample; may be at a higher dilution. 2. Report both analyses. Document any observations and corrective action in the case narrative.
Internal Standards **(Accuracy)**	Where applicable: All samples and blanks (including MS/MSD)	Response -50% to +300% (water only) of internal standards from continuing calibration of the day.	1. Reanalyze. 2. If still outside of the limits, report both analyses. 3. Document any observations and corrective action in the case narrative.

Table 3-7. Explosives using USEPA Method 8095 quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Identification	Samples, blanks, and QC data.	Retention times must be within established retention time windows or must meet relative retention time criteria. **Dual column confirmation (quantitative and qualitative) analysis is required.** Retention time windows must be provided for each calibration verification. USEPA CLP Form 10 Summary form, providing the percent difference and retention times for all detected analytes in samples and QC samples, will be provided. Percent difference must be less than 40 %D. %D calculation: Difference between A-B, divided by average of A and B, times 100.	1. Investigate problem; reanalyze calibration standards to check for retention time shift. 2. Document any observations and corrective action in the case narrative.
Quantitation	Samples, blanks, and QC data.	**Confirmation analysis is required.** Internal or external standard method may be used. Verify concentration is within linear calibration range of standards. Every effort must be made to meet specified RL requirements. Lab must state the technique used for quantitation of results for the samples.	1. If concentration is above calibration range, dilute sample and reanalyze. Dilution should result in concentration in the upper calibration range of the instrument. 2. Document any observations and corrective action in the case narrative.
Field Blank Analysis **(Sensitivity)**	As per QAPP	Less than RL.	1. Investigate problem; reanalyze to verify laboratory cross contamination is not a factor. 2. Document any observations and in the case narrative.

Table 3-7. Explosives using USEPA Method 8095 quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Field Duplicate Analysis **(Precision)**	As per QAPP	Validation criteria: 30% RPD for waters, 50% RPD for solids. For sample results that are less than or equal to five times the RL, the criterion of plus or minus two times the RL will be applied to evaluate field duplicates.	No corrective action required of the laboratory since the laboratory will not know the identity of the field duplicate samples. If these criteria are not met, sample results will be evaluated on a case-by-case basis during the validation process.
Chromatography Presentation	For each standard, sample and QC sample analysis.	Copies of chromatograms provided in the data package must be large enough to view during validation. In the case that matrix interference is detected or manual integration is performed, enlarged copies of those manipulations will be included in the data package for review.	1. Provide requested information.
Sample Batching	The laboratory will batch project samples together along with QC samples specified from the project. Non-project information will not be included in the data packages. USEPA Form 8 Summary form, providing the date, time of analysis of samples and QC samples, surrogate retention times and surrogate retention time window, will be provided.	Not applicable	Not applicable
Confirmation Analysis	Dual column quantitation and qualitative confirmation will be performed. The information presented in CLP Form 10 will be provided in the data package for evaluation.	Not Applicable	Not Applicable

Table 3-7. Explosives using USEPA Method 8095 quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Laboratory control limits	Generated with results for an analyte from a minimum of 20 sample analyses. The average of the sample results and the standard deviation are calculated. The internal warning limits are established at 2 times the standard deviation and the control limits are established at 3 times the standard deviation. The control limits are updated annually.	Not applicable	Not applicable
Percent solids	For solids samples, the percent solids will be determined and sample results will be corrected for percent solids.	Not applicable	Not applicable
Dilutions	1. When target analyte concentration exceed upper limit of calibration curve. 2. When matrix interference demonstrated by lab and documented in the case narrative (highly viscous samples or a large number of non-target peaks on the chromatogram). 3. Laboratory will note in the data deliverables which analytical runs were reported.

Audit Parameter (DQI)	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Laboratory Corrective Action (Applies to both primary and confirmation columns)
Deliverables as required	1. Full NJDEP deliverables must be provided to document each audit item for easy reference and inspection. 2. An example calculation will be provided for each analysis, for each type of matrix in the data package using samples from the project. 3. Any laboratory abbreviations or notations presented in the raw data or summary information will be explained or referenced in the case narrative. 4. Final spiking concentrations will be presented in summary form. 5. Standard tracing information will be provided. 6. Cooler temperatures will be provided in the data packages. 7. Run logs with laboratory notations clearly defined will be provided in the data packages.	Not applicable	Provide missing or additional deliverables for validation purposes.
Method and QAPP requirements	The laboratory will perform the method as presented in this QAPP and will adhere to the QAPP requirements presented herein. Otherwise the laboratory will specifically note any procedures that differ from the method or the QAPP in the data package case narrative.	Not applicable	Not applicable

Note

Data validation will be performed in accordance with QA/QC criteria established in these tables and the analytical methods that are currently used by the laboratory. Excursions from QA/QC criteria will be qualified based on guidance provided in this QAPP.

Communications with the QAO will be documented and included in the data packages.

Table 3-8. Perchlorate using USEPA Method 6850 quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Control Limits	Laboratory Corrective Action
Sample preservation	Samples must be preserved based on method and QAPP requirements	For aqueous and solid samples: cooler temperature ≤6°C. See Table 1 for sample preservation information.	Notify Project Manager since re-sampling may be required. Document corrective action in the case narrative.
Holding times (Sensitivity)	Samples must be extracted and analyzed within holding time.	Aqueous - Analysis 28 days from collection. Solid - Extract within 28 days from collection. Analyze extracts within 28 days of extraction.	1. If holding times are exceeded for initial or any re-analyses required due to QC excursions, notify the Project Manager immediately since re-sampling may be required. 2. Document any observations and corrective action in the case narrative.
Tuning (Accuracy)	Once every 24 hours (daily) prior to initial calibration and calibration verifications.	Autotune the instrument. Documentation of tune results must be included in the data packages.	Re-tune the instrument. Document any observations and corrective action in the case narrative. Samples cannot be analyzed until control limit criteria have been met.
Initial Calibration **For Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS)** **(Accuracy)**	Prior to start up and when criteria are exceeded for continuing calibration verification. Quantitation of analyses will utilize the initial calibration results. Initial calibration verification (ICV)	1.Six concentrations, method suggested range from 0.4 to 25 ug/L. One calibration standard should be at concentration less than or equal to the RL. It is recommended that if results are reported below the RL, a separate standard at the MDL level analyzed after calibration is complete to check sensitivity. 2. Linear regression calibration that does not pass through the origin with a correlation coefficient (r) >0.995 is used for quantitation; or a nonlinear first or second order calibration curve with a coefficient of determination (COD) of >0.9950 is used for quantitation.	1. Identify and correct problem. 2. Recalibrate instrument; samples should not be analyzed until initial calibration and ICV criteria are met. 3. Document any observations and corrective action in the case narrative.

Table 3-8. Perchlorate using USEPA Method 6850 quality control requirements and corrective actions

Audit Parameter (DQI)	Frequency	Control Limits	Laboratory Corrective Action
Initial Calibration Verification (ICV) (Accuracy)	Second source calibration verification standards must be analyzed after the initial calibration.	Second Source ICV result must be within 15% of the true value.	1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate; reanalyze samples back to last compliant calibration standard. Samples must be bracketed by compliant calibration standards. 3. Document any observations and corrective action in the case narrative.
Calibration Verification (Accuracy)	Second source calibration verification standards must be analyzed after every 10 samples and at the close of the sequence. CCV concentrations alternate between low and mid-range of the calibration curve range.	Second Source CCV result must be within 50% of the true value for the low-range and 15% of the true value for the mid-range.	1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate; reanalyze samples back to last compliant calibration standard. Samples must be bracketed by compliant calibration standards. 3. Document any observations and corrective action in the case narrative.
Method Blank Analysis (Sensitivity)	Method Blank : 1 per 20 samples of similar matrix prepared at the same time as the samples.	Less than RL.	1. Reanalyze. 2. If limits are still exceeded, re-prepare and reanalyze method blank and associated samples. Samples must not be analyzed until method blank criteria are met. 3. Document any observations and corrective action in the case narrative.
