Soil Analytical Results – Areas of Presumed Remedial Action

Appendix B1. TNT Area Description (Tier I)
Kenvil Works Facility
Kenvil, New Jersey

This area, a conglomerate of adjacent areas of concern, represents one of the earliest developed portions of the site as well as the site of one of the most powerful explosions in the history of the site. This area of the site produced explosives for more than a century; during this period operational procedures and incidental release of materials affected soil and groundwater quality. Areas of stressed vegetation, as well as areas devoid of vegetation (former footprint of Building 666 that exploded in 1917) are visible. Stained soil and discolored water have been observed in a former lagoon area (depression in ground surface) where overburden groundwater interacts with surface soil and discharges becoming surface water. As a result, Hercules has conducted pre-design investigations and laboratory studies as part of a remedial action selection process informing active remediation. Specifically, Hercules is evaluating a combination of source removal, bioremediation, and monitored natural attenuation to address constituent concentrations (primarily TNT and its breakdown products) in this area.

Appendix B2. Ammonium Nitrate Area Description (Tier II)
Kenvil Works Facility
Kenvil, New Jersey

From the beginning of production onsite through the end of WWI, off-specification product and residual materials were transported via rail car to the Ammonium Nitrate Area (near the World War I Burning Grounds and wastewater treatment plant; grid cell references H12-237, H13-1, H13-7). The contents of the rail car were emptied down a slope where the materials were incinerated in place on the ground surface. Currently, the area supports sparse vegetation and the ground surface contains a non-combustible fraction of the waste materials (e.g., metal). As a result, Hercules has initiated a remedial action selection process to inform active remediation. Specifically, Hercules plans to excavate surface soil, and consolidate and cap it at a to-be-determined location elsewhere onsite.

Appendix B3. B-Line Area Description (Tier II)
Kenvil Works Facility
Kenvil, New Jersey

The B-Line Area – disposal area in grid cell M8-1 served as a disposal area for process waste materials during the period of increased production surrounding World War II (WWII). The area currently consists of a low-lying depression with visible surface debris. Vegetation is moderate to sparse and consists of grasses and shrubs. The area occurs between Duck Pond and an emergent/forested wetland complex.

Given the presence of potential solid waste and/or source material in this area, Hercules is conducting a pre-design investigation to support remedial design focused on targeted removal and offsite disposal.

Appendix B4. Diazo Area Description (Tier II)
Kenvil Works Facility
Kenvil, New Jersey

The Diazo Area – diazo ponds in grid cell H8-1 is a remnant operational feature located in the Diazo Area. Historical diazo production processes generated a spent acid sludge that was neutralized via a sodium hydroxide bath and then disposed of in a shallow man-made lagoon (pond). Over time the production process changed and the sludge was managed to reclaim/reuse certain production materials rather than being disposed of. The pond area was covered with soil. SI test pit investigations identified layers of sludge comingled with soil in the location of the former disposal pond. Analytical testing indicates that the sludge does not present chemical concerns. However, the remnant feature will be remediated to better position the site for redevelopment (e.g., soil stability).

Hercules conducted a pre-design investigation in fall 2014 to gather information supporting excavation and stabilization of the material in the Diazo Pond Area. Remedy design is currently underway.

Appendix B5. Development Area (Tier II)
Kenvil Works Facility
Kenvil, New Jersey

The development area, and old burning ground and adjacent areas of concern to the southwest (grid cell references M5-3, L5-2313, L5-10, L5-2275, L5-539) was used to dispose off-spec and residual energetic materials and was situated in a low-lying area adjacent to Duck Pond to provide a source of water and a buffer from nearby forested areas. Currently, the area supports sparse vegetation and the ground surface contains a non-combustible fraction of the waste materials (e.g., metal). Hercules will address the former burning grounds via a combined remedy involving removal, consolidation, and/or containment of these materials. Pre-design investigations supporting remedial design are underway.

Appendix B6. Storage Area Description (Tier III)
Kenvil Works Facility
Kenvil, New Jersey

The Storage Area – disposal area in grid cell N6-1 served as a disposal area for process waste materials during the period of increased production associated with WWI and the years that followed. Over time, soil has accumulated at the ground surface and the area has almost entirely revegetated with grasses and shrubs. Miscellaneous debris is present at ground surface in places. Hercules performed a focused removal of large metal debris during site demolition.

Given the presence of potential source material in this area, Hercules will address the removal and/or containment of these materials during the feasibility study (FS) process.

Appendix B7. B-Line Area – South Description (Tier III)
Kenvil Works Facility
Kenvil, New Jersey

Various areas of concern including process buildings and structures (e.g., basins, sheds) existed at the southern end of the B-Line Area near the terminus of Powder Mill Road. During decommissioning and demolition activities, residual product was observed in soil at various locations in this area and remediated. A review of SI/RI sample results identified an aggregation of locations surrounding former structures that share similar site-related influences approximately 11 acres in size. Hercules will address removal and/or containment these materials during the FS process. Soil samples collected around the DNT Heater House in Figure 3-2 were evaluated in the ERA.

Appendix B8. A-Line Area – Northwest Description (Tier III)
Kenvil Works Facility
Kenvil, New Jersey

Historical records indicate that two buildings in the northwestern corner of the A-Line Area were destroyed during a fire and explosion. The buildings were later rebuilt on the site of the incident. During the SI/RI investigation and decommissioning and demolition activities, evidence of explosions (e.g., physical debris and residual source material) were identified in the area surrounding the former building locations. A review of SI/RI sample results identified two areas where these historical influences were evident. As such, Hercules will address the removal and/or containment of these materials during the FS process.

1. Introduction

Hercules Incorporated (Hercules) prepared this Evaluation of Potential Ecological Risks Beyond the Remedial Area as a technical appendix to the Ecological Risk Assessment (ERA) for the Kenvil Works Facility located on Hercules Road in Kenvil, Morris County, New Jersey (NJ) (the Facility). The ERA focuses the quantitative evaluation of potential risks on areas within the Remedial Area of the Facility. This appendix supplements the ERA, and discusses information regarding potential risk to receptors in the miscellaneous/offsite areas located beyond the Remedial Area boundary (Figure C-1).

2. Purpose and Objectives

As presented in the ERA, the site investigation (SI) evaluated the entire Facility, and generated data necessary to define the "Remedial Area" consisting of the former operational areas and those areas immediately adjacent to former operational areas influenced by Facility operations (Figure C-1). The SI concluded that no additional evaluation of miscellaneous/offsite areas beyond the Remedial Area was required. Building upon the SI findings, the remedial investigation (RI) focused on characterization of the Remedial Area.

To evaluate potential ecological risk, this ERA separates the Facility into three general categories:

- Undeveloped areas beyond the Remedial Area where ecological risk is assumed unlikely.

- Areas within the Remedial Area where constituent concentrations and/or physical characteristics merit remediation (e.g., ecological risk likely), regardless of the outcome of the ERA process (hereafter referred to as Areas of Presumed Remedial Action).

- Areas within the Remedial Area where ecological risk is uncertain.

The establishment of the Remedial Area during the SI relied upon the New Jersey Department of Environmental Protection's human health-based, non-residential soil remediation standards and did not consider ecological screening benchmarks (ESBs). This technical appendix evaluates the soil dataset for the miscellaneous/offsite areas beyond the Remedial Area in the context of potential ecological risk, Owing to the general absence of historical Facility operations in these areas, potential ecological risk is presumed to be unlikely.

Consistent with the RI (Hercules 2007), data from the areas of concern (AOCs) (i.e., O13-1 and O13-2) associated with the active pistol/trap range are not considered, as the range remains in use by the Hercules Sportsman's Club, Roxbury Township Police, and Mount Olive Police. These AOCs will be addressed separately in accordance with NJDEP's range closure and remediation regulations.

3. Data Evaluation & Risk Characterization

The dataset evaluated herein includes 159 surface soil (as defined in the ERA) samples analyzed for various constituents collected from areas beyond the Remedial Area (Figure C-2, Exhibit A). These data were evaluated using a streamlined approach consistent with the dataset screening process (i.e., frequency of detection, duplicate and redundant analyses) outlined in the ERA (ERA Section 3.3).

3.1 Direct Contact Exposure

The 95th percentile upper confidence limit of the mean (95UCL) was calculated for each constituent detected at least five times in the surface soil dataset, and the resulting values compared to conservative ESBs for soil invertebrates and terrestrial plants to evaluate potential direct contact exposure risks. Where soil invertebrate and terrestrial plant screening values were not available general soil ESBs were used. The table below identifies constituent hazard quotients (HQs) greater than 1, as presented in Table C-1.

Compound	Terrestrial Plant HQ	Soil Invertebrate HQ	Soil HQ[1]
Aluminum	385	NSV	--
Chromium*	9	0.5	--
Copper*	2	1	--
Manganese	2	12	--
Selenium*	3	0.4	--
Vanadium	18	2	--
Zinc*	11	15	--
Nitrocellulose	NSV	NSV	2

Notes:
* – bioaccumulative or site-related constituents carried through to upper trophic level receptor dietary dose modeling.
1 – HQs were only calculated using general soil ESBs when values for terrestrial plants and soil invertebrates were not available.
NSV – No screening value

3.2 Food Web Transfer Exposure

Upper trophic level receptor exposures via food web transfer exposure were also evaluated. Surface soil exposure point concentrations (EPC) that yield a lowest-observed adverse effects level hazard quotient [HQ] of 1 were back-calculated for bioaccumulative and site-related constituents summarized in the table above using the dietary dose models from the ERA (ERA Section 4.2). Table C-2 presents back-calculated EPCs for each constituent by receptor species. Exhibit B presents the dietary dose models for each receptor used to back-calculate the EPCs.

The 95UCL for each constituent was compared to the lowest species-specific, back-calculated EPC yielding an HQ of 1 for each constituent, a value protective of each upper trophic level receptor species modeled, to identify potential ecological risks to upper trophic level receptors. The table below summarizes the comparison.

COPEC	95UCL (mg/kg)	Back-Calculated EPC (HQ of 1)	HQ
Chromium	26	337	0.08
Copper	106	112	0.9
Selenium	1.5	4	0.4
Zinc	1,817	14,087	0.1

Notes:
mg/kg – milligrams per kilogram

In addition to the metals summarized in the table above, nitrocellulose also exceeded ESBs for direct contact exposure scenarios. Exposure parameters to support modeling of nitrocellulose are unavailable. Nitrocellulose is discussed further in Section 3.3.

As summarized in the table above, HQs are less than one, indicating that potential ecological risk to upper trophic level wildlife is unlikely.

3.3 Uncertainty

As noted in the main body of the ERA, uncertainty exists in every evaluation when comparing a statistical representation of a dataset to generic ESBs and other toxicological benchmarks. The ERA provides a discussion of common sources of uncertainty inherent to the risk assessment process. Specific elements that introduce uncertainty into this technical appendix are discussed below.

Triphenylene, an isomer of chrysene, was evaluated in certain surface soil samples (n=36) collected from outside the Remedial Area during SI activities. The structural and chemical similarities between triphenylene and chrysene often result in co-elution during laboratory analysis, making differentiation and quantification of each constituent difficult. The ecotoxicology of triphenylene is poorly studied, and ESBs and toxicity reference values are unavailable. Conversely, chrysene is one of the 17 priority pollutant polycyclic aromatic hydrocarbons (PAHs) and extensive ecotoxicological data and screening information exists, including values presented in the NJDEP Ecological Screening Criteria table. The Outside Remedial Area surface soil dataset includes 142 samples analyzed for chrysene, approximately 4 times the number of samples analyzed for triphenylene. NJDEP's Office of Quality Assurance responsible for identifying and certifying laboratory analytical parameters does not recognize triphenylene as an analyte (NJDEP 2014). Based on the similarities between the two constituents, a more robust chrysene dataset, and recognition of chrysene as a quantifiable constituent by NJDEP's laboratory program, the evaluation of chrysene serves as a surrogate for the evaluation of triphenylene in this technical appendix. This approach contributes a degree of uncertainty to the assessment. The direction of uncertainty is unknown, and the similarity of these constituents likely limits the magnitude of any uncertainty.

ESBs specific to plants and invertebrates were unavailable for nitrocellulose. Nitrocellulose exceeded the conservative soil ESB used as a surrogate and was carried through to the food web transfer modeling evaluation. However, no TRVs exist for birds or mammals. Ellis et al. (1980) found that dietary exposure to nitrocellulose at up 10 percent by weight (dry) in mice, rats, cats, and dogs yielded no chemical-driven toxicological effects and noted that nitrocellulose acted simply as inert dietary bulk. The nitrocellulose EPC calculated for this evaluation was 0.01 percent (111 mg/kg). While the inability to model nitrocellulose contributes uncertainty, toxicological information available in the scientific literature indicates that potential ecological risks related to nitrocellulose exposure is negligible.

4. Conclusions

The potential for ecological risk via exposure to surface soil in the area outside the Remedial Area boundary was evaluated via a comparison of 95UCLs to conservative ESBs to evaluate potential direct contact exposure and via dietary dose modeling to evaluate food web transfer. Seven metals and an energetic constituent exceeded ESBs for direct exposure scenarios. Four of the seven metals were bioaccumulative and thus were carried through food web modeling. Food web model HQs were less than one for each constituent. Based on these results, potential ecological risks beyond the Remedial Area are unlikely.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value
is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Table C-2. Summary of COPECs with Hazard Quotients Exceeding 1 for Terrestrial Wildlife Beyond the Remedial Area
Kenvil Works Facility
Kenvil, New Jersey

COPECs	Back Calculated Acceptable EPC Levels Considering LOAEL TRVs							Minimum
	American Robin	Red-Tailed Hawk	Northern Bobwhite	Short-Tailed Shrew	White-Tailed Deer	Red Fox	Minimum	Receptor
Metals								
Chromium	337	11003	17021	955	85171	14519	337	Robin
Copper	112	6240	10355	229	92227	8294	112	Robin
Selenium	4	232	57	4	58	87	4	Robin
Zinc	14087	363628	532188	183900	6700121	743763	14087	Robin
Explosives and Energetics								
Nitrocellulose	- -	- -	- -	- -	- -	- -	- -	- -

Notes:
COPEC = constituent of potential ecological concern
LOAEL = lowest observed adverse effects level
"- -" = not applicable
TRV = toxicity reference value

Table C-3. EPC Comparison Table
Kenvil Works Facility
Kenvil, New Jersey

COPEC	n	Detects	Range of Detects	FOD (%)	Distribution	Maximum Detect (mg/kg)	Exposure Point Concentration (95UCL) (mg/kg) Outside Remedial Area, Inside Site Boundary		Lowest Back Calculated Acceptable EPC Values Considering LOAEL TRV (mg/kg)	Receptor (robin, fox, etc)	Hazard Quotient
Metals											
Chromium	91	91	2.58 - 125	100	Nonparametric	125	26	UCL	337	Robin	0.08
Copper	140	127	1.25 - 3950	90.7	Nonparametric	3950	106	UCL	112	Robin	0.9
Selenium	140	64	0.55 - 8.19	45.7	Nonparametric	8.19	1.5	UCL	4	Robin	0.4
Zinc	140	134	1.24 - 45000	95.7	Nonparametric	45000	1817	UCL	14087	Robin	0.1
Explosives and Energetics											
Nitrocellulose	90	39	40.7 - 244	43.3	Nonparametric	244	111	UCL	- -	- -	- -

Notes:
95UCL = 95th percentile upper confidence limit of the mean
EPC = exposure point concentration
COPEC = constituent of potential ecological concern
FOD = frequency of detection
mg/kg = milligrams per kilogram
n = sample size
NOAEL = no observed adverse effects level
LOAEL = lowest observed adverse effects level
"- -" = not applicable

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

Notes:
COPEC = constituent of potential ecological concern
mg/kg = milligrams per kilogram
NA = not available
N = no
ND = constituent not detected
NSVA = no screening value available
U = Compound not detected. Associated value is compound quantitation limit
J = Estimated concentration
Y = yes
"--" = not applicable
(a) = Due to uncertainties in the triphenylene data set, ecological risk assessed using the structurally similar compound chrysene.

1. Introduction

Hercules Incorporated (Hercules) prepared this *Ecological Risk Assessment of Polychlorinated dibenzo-p-dioxins and Polychlorinated dibenzo-p-furans (PCDD/F) in Former Burning Areas* as a technical appendix to the Ecological Risk Assessment (ERA) for the Kenvil Works Facility located on Hercules Road in Kenvil, Morris County, New Jersey (NJ) (the Facility) (Figure D-1). This evaluation was prepared consistent with New Jersey Department of Environmental Protection (NJDEP) *Ecological Evaluation Technical Guidance* (2015) and United States Environmental Protection Agency (USEPA) *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments* (1997).

As a component of completing the remedial investigation at the Facility, potential former burning grounds onsite were sampled for PCDD/F in November 2013. The ERA evaluated terrestrial exposures using a single, Facility-wide exposure area and a robust surface soil sample dataset. The PCDD/F surface soil dataset characterizes discrete areas within the Facility-wide exposure area. Given the spatial disparity of the two datasets, this technical appendix supplements the Facility-wide evaluation of terrestrial exposures presented in the ERA with specific information regarding potential exposure risks for terrestrial receptors to PCDD/F mixtures in soils in former burning grounds onsite.

2. Problem Formulation

Historically, burning served as a means of disposing of off-specification explosive and energetic (E&E) materials and decontaminating and demolishing structures that supported E&E manufacturing. These industry standard practices were used through the late 1800s and up until the 1970s at the Facility, and generally occurred in specific areas (i.e., burning grounds) onsite. Residual materials and combustion by-products likely comingled with surface soil in these areas and may pose potential ecological risks to receptors using former burning grounds at the Facility.

2.1 Exposure Pathways

Potential ecological receptors may be directly or indirectly exposed to PCDD/F in soil if a complete exposure pathway exists. A potential soil exposure pathway is considered complete if it contains the following elements:

- A constituent source
- Receptor contact at the exposure point
- An exposure route

Based on the criteria listed above, potentially complete exposure pathways linking PCDD/F in Facility soil and ecological receptors exist.

2.2 Assessment and Measurement Endpoints

The following assessment (AE) and measurement endpoints (ME) were identified based on potentially complete direct and indirect exposure pathways. PCDD/F can bioaccumulate in upper trophic level organisms, with exposures generally occurring via ingestion of food items with a PCDD/F body burden. PCDD/F toxicity does not occur in plants or terrestrial invertebrates (USEPA 2008; Hahn 2002). The AEs and MEs presented below consider PCDD/F exposure routes and toxicity mechanisms.

AE 1. Could food-chain transfer of PCDD/F in former burning area soil adversely affect reproductive success or survival of herbivorous avian and mammal populations?

> ME 1. Compare modeled dietary PCDD/F exposure to TRVs (calculate hazard quotients [HQs]) for herbivorous mammals and birds (represented by white-tailed deer and northern bobwhite).

AE 2. Could food-chain transfer of PCDD/F in former burning area soil adversely affect reproductive success or survival of insectivorous avian and mammal populations?

> ME 2. Compare modeled dietary PCDD/F exposure to TRVs (calculate HQs) for insectivorous mammals and birds (represented by short-tailed shrew and American robin).

AE 3. Could food-chain transfer of PCDD/F in former burning area soil adversely affect reproductive success or survival of carnivorous avian and mammal populations?

> ME 3. Compare modeled dietary PCDD/F exposure to TRVs (calculate HQs) for carnivorous mammals and birds (represented by red fox and red-tailed hawk).

2.3 Data Summary

Twenty surface soil samples were collected from five discrete areas either known to or suspected to have supported historical thermal destruction activities at the Facility and analyzed for PCDD/F congeners. Figure D-2 illustrates PCDD/F sample locations. Five of the twenty samples were collected from the former burning ground northwest of Duck Pond. This area (Development Area – Old Burning Ground and adjacent areas of concern to the southwest [M5-3, L5-2313, L5-10, L5-2275, L5-539]) was identified as an Area of Presumed Remedial Action in the ERA. As such, the five samples from this area were excluded from this evaluation. One additional sample falls within the footprint of a World War I era burning grounds (Ammonium Nitrate Area – Former Burning Ground and intervening areas of concern [H12-237, H13-1, H13-7]) which was also designated as an Area of Presumed Remedial Action in the ERA. However, the boundaries of this area are being refined as part of a pre-design investigation. As such, this sample was conservatively included in the PCDD/F evaluation dataset.

Table D-1 presents summary statistics for the 15-sample dataset. Exhibit A presents the PCDD/F dataset.

Congener toxicity varies based on the number and position of chlorine atoms in the molecule. Toxic equivalency factors (TEFs) normalize the toxicity of each individual congener to the toxicity of the most toxic congener (2,3,7,8-tetrachlorodibenzodioxin [TCDD]). This procedure assigns individual TEFs to each congener (Van den Berg et al. 1998, 2005). TEFs specific to avian or mammalian tissue are used based on the associated endpoint. The concentration of each congener is multiplied by its respective TEF. The results are summed to obtain a toxicity equivalency quotient (TEQ) (Table D-1). This process yields TEQ-based PCDD/F soil concentrations for use as exposure point concentrations (EPC) and to support estimation of dietary item tissue concentrations.

3. Exposure Assessment

PCDD/F exposure was evaluated using dietary dose modeling consistent with that presented in the ERA. Receptor-specific exposure parameters remain unchanged. PCDD/F-specific values for soil are described below.

EPC representing the PCDD/F mixture in soil across the assessed area were calculated to support upper trophic level dietary dose modeling. For each congener, a 95th upper confidence limit of the mean of the data (95UCL), calculated using ProUCL Version 4.1.00, was multiplied by its TEF and the result summed to derive a TEQ-based EPC. Table D-1 summarizes TEQ-based EPCs for mammals and birds used in upper trophic level dietary dose models.

Upper trophic level dietary dose modeling also requires plant, terrestrial invertebrate, and mammalian prey item tissue concentrations. The receptor-specific soil EPCs and congener-specific bioaccumulation factors (BAFs) from USEPA (1999) are used to estimate PCDD/F concentrations in dietary items. Table D-2 summarizes these values.

4. Effects Assessment

The ecological effects assessment describes the potential effects associated with the exposure of ecological receptors to PCDD/F, and reflects the type of assessment endpoints selected.

4.1 Toxicological Properties of PCDD/F

Toxicity of individual PCDD/F congeners is related to the toxicity of 2,3,7,8-TCDD which is known to be the most toxic of the congeners (Van den Berg et al. 1998). Toxic effects can include dermal toxicity, immunotoxicity, carcinogenicity, and adverse effects on reproduction, development, and endocrine functions (Van den Berg et al. 1998). To assess the toxicity of a specific PCDD/F mixture, TEFs are calculated by relating their toxicity to the toxicity of 2,3,7,8-TCDD as previously discussed.

The aryl hydrocarbon receptor (AhR), responsible for the mechanism of PCDD/F toxicity in vertebrate species, fails to bind PCDD/F in non-vertebrate organisms (Hahn 2002). As such, PCDD/F does not exhibit toxicity in plants or soil invertebrates (USEPA 2008, Hahn 2002). For mammals, TEF toxicity is based on semi-chronic studies with mink. For birds, a number of study types (egg injection studies, studies with cultured avian hepatocytes, and studies with cultured thymus cells) and organisms (chicken, duck, goose, turkey, pheasant, gull, tern, cormorant, and kestrel) were considered together to assess the toxicity of individual congeners via TEFs (Van den Berg et al. 1998).

4.2 Toxicity Reference Values

The TRV for mammalian receptors is based on a laboratory study of potential effects on reproduction in rats exposed to 2,3,7,8-TCDD via the diet for three consecutive generations, as presented in Sample et al. 1996. Effects noted include reduced fertility and neonatal survival at the two highest dose levels included in the study. For birds, the selected TRV is based on a laboratory study of reproductive effects (i.e., egg production and hatchability) in ring-necked pheasants receiving weekly intraperitoneal injections of 2,3,7,8-TCDD over a 10-week period inclusive of the reproductive period. The study identified reduced egg production and hatchability at the highest dose level (Sample et al. 1996). Table D-3 summarizes TRVs for avian and mammalian receptors.

5. Risk Characterization

Dietary dose models evaluated potential exposures to insectivores (American robin and short-tailed shrew), carnivores (red-tailed hawk and red fox), and herbivores (bobwhite quail and white-tailed deer). Dietary dose model results were compared to TRVs to derive hazard quotients (HQs). A bounded range of HQs estimate potential risks based on no observed adverse effects level (NOAEL) and lowest observed adverse effects level (LOAEL) TRVs. Tables D-4 through D-9 present upper trophic level dietary dose models. Table D-10 summarizes LOAEL-based HQs (HQ_{LOAEL}) and NOAEL-based HQs (HQ_{NOAEL}).

When characterizing risk to a receptor species population, there are several possible interpretations for an HQ value. HQ_{NOAEL} greater than one indicate that potential adverse effects are possible, and HQ_{LOAEL} greater than one suggest that adverse effects are likely. Similarly, HQ_{NOAEL} less than one indicate that potential adverse effects are negligible, and HQ_{LOAEL} less than one suggest that adverse effects are unlikely. HQ_{LOAEL} and HQ_{NOAEL} provide a bounded range of risk estimates for consideration. Acknowledging the conservative assumptions on which this ERA is based, consideration of the HQ_{LOAEL} is appropriate.

HQ_{LOAEL} for each receptor are presented in Table D-10 and summarized in the table below.

Receptor	HQ_{LOAEL}
Northern Bobwhite	≤1
White-tailed Deer	≤1
American Robin	≤1
Short-tailed Shrew	≤1
Red-tailed Hawk	≤1
Red Fox	≤1

As summarized in the table above, HQ_{LOAEL} are less than one for each receptor.

6. Results and Conclusions

This technical appendix presents an assessment to PCDD/F in former burning areas at the Facility. Estimated PCDD/F exposure (i.e., dose) for upper trophic level wildlife was compared to literature-based TRVs to calculate HQs. An interpretation of HQ values relative to each assessment and measurement endpoint follows.

AE 1. Could food-web transfer of PCDD/F in former burning area soil adversely affect reproductive success or survival of herbivorous avian and mammal populations?

Results of the exposure assessment, effects characterization, and risk characterization indicate that adverse effects to herbivorous avian and mammal populations by exposure to PCDD/F are unlikely.

This is a reasonable finding based on the uncertainty inherent to the exposure and effects assessment process and the use of conservative (i.e., protective) assumptions that generally bias exposure and effects assessments toward overestimation of potential risk.

This conclusion is supported by the following measurement endpoints:

- HQ_{LOAEL} for northern bobwhite, an herbivorous bird, are less than 1.
- HQ_{LOAEL} for white-tailed deer, an herbivorous mammal, are less than 1.

AE 2. Could food-web transfer of PCDD/F in former burning area soil adversely affect reproductive success or survival of insectivorous avian and mammal populations?

Results of the exposure assessment, effects characterization, and risk characterization indicate that adverse effects to insectivorous avian and mammal populations by exposure to PCDD/F are unlikely.

This is a reasonable finding based on the uncertainty inherent to the exposure and effects assessment process and the use of conservative (i.e., protective) assumptions that generally bias exposure and effects assessments toward overestimation of potential risk.

This conclusion is supported by the following measurement endpoints:

- HQ_{LOAEL} for American robin, an insectivorous bird, are less than 1.
- HQ_{LOAEL} for short-tailed shrew, an insectivorous mammal, are less than 1.

AE 3. Could food-web transfer of PCDD/F in former burning area soil adversely affect reproductive success or survival of carnivorous avian and mammal populations?

Results of the exposure assessment, effects characterization, and risk characterization indicate that adverse effects to carnivorous avian and mammal populations by exposure to PCDD/F are unlikely.

This is a reasonable finding based on the uncertainty inherent to the exposure and effects assessment process and the use of conservative (i.e., protective) assumptions that generally bias exposure and effects assessments toward overestimation of potential risk.

This conclusion is supported by the following measurement endpoints:

- HQ_{LOAEL} for red-tailed hawk, a carnivorous bird, are less 1.
- HQ_{LOAEL} for red fox, a carnivorous mammal, are less than 1.

In summary, potential ecological risks associated with exposure to PCD/F in soils are unlikely. Based on these findings, no further evaluation of potential ecological risks associated with PCDD/F are recommended.

Analyte	Soil EPC (mg/kg)	Body Weight (kg)	C_{mammal} (mg/kg)	Daily Ingestion Rate (kg/day)	Soil Ingestion Rate (kg/day)	Daily Dietary Dose (mg/kg/d)	TRV (mg/kg-d)		HQ	
							NOAEL	LOAEL	NOAEL	LOAEL
PCDD/F	0.000027	4.54	0.000021	0.16	0.0046	0.00000078	0.000001	0.00001	0.8	0.08

Abbreviations:
C = concentration
EPC = exposure point concentration
HQ = hazard quotient
kg = kilogram
kg/day = kilogram per day
LOAEL = lowest observed adverse effects level
mg/kg = milligram per kilogram
mg/kg/day = milligram per kilogram per day
mg/kg-d = milligram per kilogram day
NOAEL = no observed adverse effects level
TRV = toxicity reference value

Table D-9. White-tailed Deer PCDD/F Hazard Quotients
Kenvil Works Facility
Kenvil, New Jersey

Analyte	Soil EPC (mg/kg)	Body Weight (kg)	C_{plant} (mg/kg)	Daily Ingestion Rate (kg/day)	Soil Ingestion Rate (kg/day)	Daily Dietary Dose (mg/kg/d)	TRV (mg/kg-d)		HQ	
							NOAEL	LOAEL	NOAEL	LOAEL
PCDD/F	0.000027	56.50	0.00000013	0.26	0.0052	0.0000000031	0.000001	0.00001	0.003	0.0003

Abbreviations:
C = concentration
EPC = exposure point concentration
HQ = hazard quotient
kg = kilogram
kg/day = kilogram per day
LOAEL = lowest observed adverse effects level
mg/kg = milligram per kilogram
mg/kg/day = milligram per kilogram per day
mg/kg-d = milligram per kilogram day
NOAEL = no observed adverse effects level
TRV = toxicity reference value

Table D-10. Terrestrial Wildlife LOAEL-Based Hazard Quotient Summary
Kenvil Works Facility
Kenvil, New Jersey

Receptor	HQ - LOAEL
Northern Bobwhite	0.0005
White-tailed Deer	0.0003
American Robin	0.2
Short-tailed Shrew	0.3
Red-tailed Hawk	0.01
Red Fox	0.08

Abbreviations:
HQ = hazard quotient
kg = kilogram
LOAEL = lowest observed adverse effects level

		Number of Missing Observations	247
Number of Detects	108	Number of Non-Detects	369
Number of Distinct Detects	82	Number of Distinct Non-Detects	45
Minimum Detect	4.3	Minimum Non-Detect	3
Maximum Detect	7600	Maximum Non-Detect	40000
Variance Detects	1455156	Percent Non-Detects	77.36%
Mean Detects	410.8	SD Detects	1206
Median Detects	36	CV Detects	2.936
Skewness Detects	4.361	Kurtosis Detects	20.14
Mean of Logged Detects	3.992	SD of Logged Detects	1.824

Normal GOF Test on Detects Only

Shapiro Wilk Test Statistic	0.383	**Normal GOF Test on Detected Observations Only**
5% Shapiro Wilk P Value	0	Detected Data Not Normal at 5% Significance Level
Lilliefors Test Statistic	0.374	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.0853	Detected Data Not Normal at 5% Significance Level

Detected Data Not Normal at 5% Significance Level

Kaplan-Meier (KM) Statistics using Normal Critical Values and other Nonparametric UCLs

Mean	97.92	Standard Error of Mean	27.47
SD	596.6	95% KM (BCA) UCL	157.3
95% KM (t) UCL	143.2	95% KM (Percentile Bootstrap) UCL	145.6
95% KM (z) UCL	143.1	95% KM Bootstrap t UCL	167.8
90% KM Chebyshev UCL	180.3	95% KM Chebyshev UCL	217.7
97.5% KM Chebyshev UCL	269.5	99% KM Chebyshev UCL	371.3

Gamma GOF Tests on Detected Observations Only

A-D Test Statistic	10.4	**Anderson-Darling GOF Test**
5% A-D Critical Value	0.859	Detected Data Not Gamma Distributed at 5% Significance Level
K-S Test Statistic	0.24	**Kolmogrov-Smirnoff GOF**
5% K-S Critical Value	0.0944	Detected Data Not Gamma Distributed at 5% Significance Level

Detected Data Not Gamma Distributed at 5% Significance Level

Gamma Statistics on Detected Data Only

k hat (MLE)	0.334	k star (bias corrected MLE)	0.331
Theta hat (MLE)	1229	Theta star (bias corrected MLE)	1240
nu hat (MLE)	72.22	nu star (bias corrected)	71.55
MLE Mean (bias corrected)	410.8	MLE Sd (bias corrected)	713.8

Gamma Kaplan-Meier (KM) Statistics

k hat (KM)	0.0269	nu hat (KM)	25.7

Approximate Chi Square Value (25.70, α)	15.15	Adjusted Chi Square Value (25.70, β)	15.13
5% Gamma Approximate KM-UCL (use when n>=50)	166.1	95% Gamma Adjusted KM-UCL (use when n<50)	166.4

Gamma (KM) may not be used when k hat (KM) is < 0.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	93.03
Maximum	7600	Median	0.01
SD	597.3	CV	6.42
k hat (MLE)	0.111	k star (bias corrected MLE)	0.112
Theta hat (MLE)	835.3	Theta star (bias corrected MLE)	830.1
nu hat (MLE)	106.3	nu star (bias corrected)	106.9
MLE Mean (bias corrected)	93.03	MLE Sd (bias corrected)	277.9
		Adjusted Level of Significance (β)	0.0495
Approximate Chi Square Value (106.92, α)	84.05	Adjusted Chi Square Value (106.92, β)	83.99
95% Gamma Approximate UCL (use when n>=50)	118.3	95% Gamma Adjusted UCL (use when n<50)	118.4

Lognormal GOF Test on Detected Observations Only

Lilliefors Test Statistic	0.138	**Lilliefors GOF Test**	
5% Lilliefors Critical Value	0.0853	Detected Data Not Lognormal at 5% Significance Level	

Detected Data Not Lognormal at 5% Significance Level

Lognormal ROS Statistics Using Imputed Non-Detects

Mean in Original Scale	95.88	Mean in Log Scale	0.888
SD in Original Scale	596.8	SD in Log Scale	2.527
95% t UCL (assumes normality of ROS data)	140.9	95% Percentile Bootstrap UCL	142.5
95% BCA Bootstrap UCL	156	95% Bootstrap t UCL	166.3
95% H-UCL (Log ROS)	91.8		

DL/2 Statistics

DL/2 Normal		**DL/2 Log-Transformed**	
Mean in Original Scale	145.7	Mean in Log Scale	2.649
SD in Original Scale	1089	SD in Log Scale	1.378
95% t UCL (Assumes normality)	227.9	95% H-Stat UCL	42.6

DL/2 is not a recommended method, provided for comparisons and historical reasons

Nonparametric Distribution Free UCL Statistics

Data do not follow a Discernible Distribution at 5% Significance Level

Suggested UCL to Use

95% KM (Chebyshev) UCL	217.7

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% H-UCL 181.5

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). However, simulations results will not cover all Real World data sets.
For additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
se of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distributio

Approximate Chi Square Value (103.92, α)	81.4	Adjusted Chi Square Value (103.92, β)	81.17
5% Gamma Approximate KM-UCL (use when n>=50)	64.45	95% Gamma Adjusted KM-UCL (use when n<50)	64.63

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	50.48

Suggested UCL to Use

95% H-UCL	316.2

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). However, simulations results will not cover all Real World data sets.
For additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
se of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distributio

k hat (MLE)	0.156	k star (bias corrected MLE)	0.161
Theta hat (MLE)	153104	Theta star (bias corrected MLE)	148165
nu hat (MLE)	11.87	nu star (bias corrected)	12.27
MLE Mean (bias corrected)	23922	MLE Sd (bias corrected)	59535

Gamma Kaplan-Meier (KM) Statistics

k hat (KM)	0.00822	nu hat (KM)	2.087
Approximate Chi Square Value (2.09, α)	0.163	Adjusted Chi Square Value (2.09, β)	0.16
5% Gamma Approximate KM-UCL (use when n>=50)	92344	95% Gamma Adjusted KM-UCL (use when n<50)	94319

Gamma (KM) may not be used when k hat (KM) is < 0.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	7158
Maximum	900000	Median	0.01

DL/2 Statistics

DL/2 Normal		DL/2 Log-Transformed	
Mean in Original Scale	7313	Mean in Log Scale	4.902
SD in Original Scale	79843	SD in Log Scale	1.309
95% t UCL (Assumes normality)	19053	95% H-Stat UCL	423.7

DL/2 is not a recommended method, provided for comparisons and historical reasons

Nonparametric Distribution Free UCL Statistics

Data do not follow a Discernible Distribution at 5% Significance Level

Suggested UCL to Use

95% KM (Chebyshev) UCL	38386

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

lowever, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statisticia

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% H-UCL	133.9

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). However, simulations results will not cover all Real World data sets.
For additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
se of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distributio

Approximate Chi Square Value (2.23, α)	0.187	Adjusted Chi Square Value (2.23, β)	0.183
5% Gamma Approximate KM-UCL (use when n>=50)	13854	95% Gamma Adjusted KM-UCL (use when n<50)	14178

Gamma (KM) may not be used when k hat (KM) is < 0.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detected data is small such as < 0.1

For such situations, GROS method tends to yield inflated values of UCLs and BTVs

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Section 1: Introduction

On behalf of Hercules Incorporated (Hercules), Kennedy/Jenks Consultants (K/J) prepared this Ecological Risk Assessment Work Plan (ERAWP) for the Hercules Kenvil Works Facility, located on Hercules Road in Kenvil, Morris County, New Jersey (the Facility). Figure 1 presents the location of the Facility; Figure 2 presents the overall layout of the Facility. This ERAWP was prepared in accordance with New Jersey Department of Environmental Protection's (NJDEP's) Technical Requirements for Site Remediation (TRSR), New Jersey Administrative Code (N.J.A.C.) 7:26E, NJDEP's Ecological Evaluation Technical Guidance (NJDEP 2015), and NJDEP's Field Sampling Procedures Manual (NJDEP 2005). Consistent with NJDEP (2015), ecological investigation and assessment activities are consistent with United States Environmental Protection Agency (USEPA) and other federal guidance, including Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments (USEPA 1997).

1.1 Purpose and Objectives

The *Ecological Evaluation/Ecological Risk Assessment* report (EE/ERA) (Hercules 2016) relied on information presented in the media-specific remedial investigation reports (RIRs) for the Facility (i.e., soil, groundwater, surface water, and sediment) prepared between 2006 and 2009 (Hercules 2006; 2007a, 2007b, 2007c, 2007d; 2009) and additional data collected during the Phase II RI investigation (OBG 2013) to evaluate potential ecological risk at the Facility. The EE/ERA approach and findings effectively focused the assessment by excluding areas of presumed remedial action, where Hercules committed to conducting remedial activities (e.g., source areas) and presenting acceptable risk estimates in undeveloped areas of the Facility. Assessment of the remaining areas of the Facility identified potential risk drivers using conservative exposure assumptions across large exposure areas.

This ERAWP builds upon the findings of the EE/ERA (Hercules 2016) and outlines data collection activities to refine EE/ERA conclusions. The objectives of this ERAWP are as follows:

- Refine exposure parameters and toxicity reference values (TRVs) based on site-specific conditions and the scientific literature
- Identify locations within the EE/ERA exposure areas driving potential ecological risk
- Focus additional data collection on those constituents of potential ecological concern (COPECs) and locations in the EE/ERA exposure areas driving potential ecological risk
- Support refined risk characterization and scientifically-based risk management decision-making

Ultimately, the information herein will be coupled with the data and field information generated by the proposed sampling activities to inform a refined risk characterization presented in an ERA addendum.

1.2 Organization

The remainder of this ERAWP is organized as follows:

- Section 2, Background, summarizes the strategy, approach, findings, and recommendations of the EE/ERA.

- Section 3, Desktop Evaluation, presents revised exposure parameters, TRVs, and other information used to refine initial, conservative risk estimates; evaluates the spatial distribution of COPECs within exposures areas; and presents an updated risk characterization to inform additional data collection.

- Section 4, Ecological Investigation – Field Sampling Plan, presents rationale and data use objectives as well as the field sampling methods and locations for data collection activities proposed in response to the refined risk characterization.

- Section 5, References, provides citations for information used during the preparation of this work plan.

Tables, figures, appendices, and attachments support the text and are referenced accordingly.

Section 2: Background

2.1 EE/ERA Summary

The EE/ERA (Hercules 2016) submitted to the Licensed Site Remediation Professional (LSRP) for the Facility in April 2016 represents the initial step in evaluating potential ecological risk at the Facility. Consistent with NJDEP (2015), ecological investigation and assessment activities were conducted in accordance with USEPA and other federal guidance, including Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments (USEPA 1997). As specified in NJDEP and USEPA guidance, the EE/ERA used conservative assumptions related to potential exposures and receptors, and leveraged Facility knowledge and associated remedial decision making processes to build upon the results of site investigation (SI)/remedial investigation (RI) activities.

The EE/ERA (Hercules 2016a) relied on information presented in media-specific RIRs for the Facility (i.e., soil, groundwater, surface water, and sediment) prepared between 2006 and 2009 (Hercules 2007, 2009) and additional data collected during the Phase II RI investigation (Hercules 2016b) to evaluate potential ecological risk at the Facility. The EE/ERA approach and findings focused the assessment by excluding areas of presumed remedial action where Hercules committed to conducting remedial activities (e.g., source areas), and presented acceptable risk estimates in undeveloped areas of the Facility.

Assessment of the remaining areas of the Facility identified potential risk using conservative exposure assumptions across exposure areas. The risk characterization and conclusions identified lead, other metals, and polycyclic aromatic hydrocarbons (PAHs) as the COPECs that pose the greatest potential to cause adverse effects to ecological receptors exposed to environmental media at the Facility. The EE/ERA also recommended additional focused evaluation to refine exposure estimates and identify areas of the Facility with the greatest potential for ecological risk.

2.2 EE/ERA Scope

Data generated during the SI supported the establishment of the Remedial Area to focus RI activities within and immediately adjacent to the former manufacturing areas, and concluded that additional investigation of the outlying undeveloped portions of the Facility (those areas beyond the former manufacturing areas [beyond the Remedial Area] was unwarranted. The EE/ERA built upon the information collected during characterization in the SI/RI phases and evaluated potential ecological risk within the Remedial Area. A review of SI/RI data and findings identified areas where historical operations (e.g., emplacement of historic fill, point source releases, process upsets, etc.) influenced environmental media within the Remedial Area. In these ways, the SI/RI informed and focused the EE/ERA. The EE/ERA separated the Facility into three general categories:

- Areas where potential ecological risk is negligible.

- Areas where potential ecological risk is uncertain and assessment is needed.

- Areas where constituent concentrations and/or physical characteristics merit remediation (e.g., ecological risk is likely), regardless of the outcome of the EE/ERA (Areas of Presumed Remedial Action).

This approach focused the EE/ERA on areas where risks may be present and does not confound the process by evaluating areas where risks are unlikely (undeveloped areas beyond the Remedial Area) or very likely (certain Areas of Presumed Remedial Action), or where proposed remedial actions will address potential exposure risks (certain Areas of Presumed Remedial Action). Using this approach, the EE/ERA identified areas of the Facility that may present unacceptable ecological risk and provided a foundation on which to base additional focused data collection and ecological evaluation.

2.3 EE/ERA Results and Recommendations

2.3.1 Risk Characterization Results

The EE/ERA (Hercules 2016a) evaluated potential ecological exposures using a series of assessment endpoints (AEs) and measurement endpoints (MEs). MEs included direct comparison of constituent concentrations in environmental media to ecological screening benchmarks (ESBs) protective of lower-trophic-level receptors (e.g., invertebrates and plants), as well as food web dose modeling of constituents into upper-trophic-level receptors. The use of generic screening benchmarks and conservative assumptions regarding the bioavailability of constituents added uncertainty to the assessment. These evaluations generated hazard quotients (HQs), ratios comparing exposure concentrations to TRVs from the scientific literature. Lowest observed adverse effects level- (LOAEL-) and no observed adverse effects level- (NOAEL-) based HQs provided a bounded range of potential risk estimates. Acknowledging the conservative assumptions on which the EE/ERA is based, consideration of the LOAEL-based HQ (HQ_{LOAEL}) is appropriate.

A summary of potential ecological risks relative to each AE and ME, as noted in the EE/ERA, is provided below:

- *AE 1*. Could direct contact with constituents of potential ecological concern (COPECs) in Facility soil affect the structure, function, and/or survival of the terrestrial plant community?
    - A comparison of soil COPEC concentrations to ESBs protective of terrestrial plants indicated that adverse effects to terrestrial plant communities are possible.
- *AE 2*. Could direct contact with COPECs in Facility soil affect the structure, function, and/or survival of the terrestrial invertebrate community?
    - A comparison of soil COPEC concentrations to ESBs protective of terrestrial invertebrates indicated that adverse effects to terrestrial invertebrate communities at the Facility are unlikely.
- *AE 3*. Could food-web transfer of COPECs in Facility soil adversely affect reproductive success or survival of herbivorous avian and mammal populations?

- HQ_{LOAELs} for northern bobwhite (*Colinus virginianus*) and white tailed deer (*Odocoileus virginianus*) indicated that adverse effects to herbivorous avian and mammal populations are unlikely.

- *AE 4*. Could food-web transfer of COPECs in Facility soil adversely affect reproductive success or survival of insectivorous avian and mammal populations?

  - HQ_{LOAELs} for American robin (*Turdus migratorius*) and short-tailed shrew (*Blarina brevicauda*) indicated that adverse effects to insectivorous avian populations are possible, but adverse effects to insectivorous mammal populations are unlikely.

- *AE 5*. Could food-web transfer of COPECs in Facility soil adversely affect reproductive success or survival of carnivorous avian and mammal populations?

  - HQ_{LOAELs} for red-tailed hawk (*Buteo jamaicensis*) and red fox (*Vulpes vulpes*) indicated that adverse effects to carnivorous avian and mammal populations are unlikely.

- *AE 6*. Could direct contact with COPECs in sediment in each exposure area affect the structure, function, and/or survival of the benthic invertebrate community?

  - Comparisons of sediment COPEC concentrations in the Northern and Southern Drainage Areas to ESBs protective of benthic invertebrates indicated that adverse effects to benthic invertebrate communities in these areas are possible.

- *AE 7*. Could direct contact with COPECs in sediment in each exposure area affect the survival and function of aquatic plant populations?

  - Comparisons of sediment COPEC concentrations in the Northern and Southern Drainage Areas to ESBs protective of terrestrial plants indicated that adverse effects to aquatic plants in these areas are possible but unlikely.

- *AE 8*. Could direct contact with COPECs in surface water in each area affect the survival and reproduction of fish and aquatic invertebrate populations?

  - Comparisons of surface water COPEC concentrations in the Northern and Southern Drainage Areas to ESBs protective of aquatic life indicated that adverse effects to fish populations in these areas are unlikely.

- *AE 9*. Could food-web transfer of COPECs in sediment in each area adversely affect reproductive success or survival of herbivorous avian and mammal populations?

  - Results of the exposure assessment, effects characterization, risk characterization, and uncertainty analysis indicated that adverse effects to herbivorous avian and mammal populations by exposure to COPECs in the Northern Drainage Area and Southern Drainage Area are unlikely.

- *AE 10*. Could food-web transfer of COPECs in sediment in each area adversely affect reproductive success or survival of insectivorous avian and mammal populations?

- HQ_{LOAELs} for tree swallow (*Tachycineta bicolor*) and little brown bat (*Myotis lucifugus*) in the Northern and Southern Drainage Areas indicated that adverse effects to insectivorous avian and mammal populations in the Northern and Southern Drainage Areas are possible.

- *AE 11*. Could food-chain transfer of COPECs in sediment in each area adversely affect reproductive success or survival of piscivorous avian and mammal populations?

  - HQ_{LOAELs} for great blue heron (*Ardea herodias*) and mink (*Neovison vison*) in the Northern and Southern Drainage Areas indicated adverse effects to piscivorous avian and mammal populations in the Northern Drainage Area are unlikely; adverse effects to piscivorous avian populations in the Southern Drainage Area are possible; and adverse effects to piscivorous mammal populations in the Southern Drainage Area are unlikely.

These are reasonable findings based on the uncertainty inherent to the exposure and effects assessment process and the use of conservative (i.e., protective) assumptions that generally bias exposure and effects assessments toward overestimation of potential ecological risk.

2.3.2 EE/ERA Recommendations

Overall, estimated potential ecological risks in the EE/ERA are low. The greatest potential for ecological risk is from lead, other metals, and PAHs. Food web modeling of upper-trophic-level receptors in terrestrial (e.g., American robin) and aquatic (e.g., tree swallow, great blue heron, and little brown bat) exposure areas yielded lead HQs greater than 1. Food web modeling on which these results are based did not incorporate measures of lead bioavailability. Soil and sediment characteristics at the Facility pointed to high levels of organic carbon and likely anoxic conditions, which lend themselves to sequestration and binding of metals, potentially reducing the fraction of lead available for uptake by receptors and associated adverse effects.

Based on the EE/ERA results and the uncertainty regarding bioavailability, additional ecological investigation and risk assessment activities are recommended. Such activities include a desktop evaluation that refines the conservative assumptions upon which modeled results are based, and by spatial analysis to identify locations within the exposure areas that are driving potential risk. Focused field data collection is also recommended, the scope of which follows the results of the desktop evaluation activities.

The following sections present the results of ecological risk assessment refinement (Section 3) and outline a field data collection program (Section 4).

Section 3: Desktop Refinement

The following section provides results of the EE/ERA for each upper-trophic species modeled, presents refined exposure parameters, and the process and results of the models using refined exposure parameters and exposure areas. The steps of the EE/ERA refinement process are depicted in the following diagram:

Desktop refinements conducted in this ERAWP include both the first and second refinement steps. First, exposure parameters are revisited and revised to be more realistic and site-specific, as necessary, to further limit the list of COPECs. Secondly, aquatic exposure areas are further sub-divided to focus areas driving potential ecological risk and direct field data collection.

3.1 EE/ERA Results

Upper-trophic level food web modeling in the EE/ERA used default exposure parameters for birds and mammals, per USEPA (1997) and NJDEP (2015) guidance. In the terrestrial area of the Facility, HQ_{LOAELs} for white-tailed deer, red fox, northern bobwhite, and red-tailed hawk were below 1, indicating lack of potential risk to these species from COPECs in soil. American robin and short-tailed shrew had HQs greater than 1 for three COPECs. The table below summarizes the HQ_{LOAELs} for the terrestrial area.

	American Robin	**Northern Bobwhite**	**Red-Tailed Hawk**	**Short-Tailed Shrew**	**White-Tailed Deer**	**Red Fox**
Total PCBs	**3**	≤1	≤1	≤1	≤1	≤1
Copper	**3**	≤1	≤1	≤1	≤1	≤1
Lead	**25**	≤1	≤1	**3**	≤1	≤1

HQ_{LOAELs} in the aquatic areas, separated into Northern and Southern Drainage Areas, were greater than 1 for the following receptors and COPECs:

	Little Brown Bat	Mink	Muskrat	Tree Swallow	Great Blue Heron	Mallard Duck
Northern Drainage Area						
Copper	**3**	≤1	≤1	**7**	≤1	≤1
Lead	≤1	≤1	≤1	**10**	≤1	≤1
Southern Drainage Area						
Copper	**2**	≤1	≤1	**4**	≤1	≤1
Fluoranthene	**6**	≤1	≤1	**3**	≤1	≤1
Lead	**26**	**8**	≤1	**224**	**24**	**2**
Pyrene	**3**	≤1	2	≤1	≤1	≤1
Selenium	**2**	≤1	≤1	**2**	≤1	≤1

To focus additional data collection, refinements were made to the food web modeling via a desktop evaluation. During this refinement step, exposure parameters were modified (if available) to be site- and species-specific, as described in the following section.

3.2 Site-Specific Exposure Parameters

3.2.1 Site Use Factors

In the EE/ERA, each wildlife species was assumed to forage only in the exposure area, by incorporating a site use factor (SUF) of 1 (i.e., 100 percent of the time). In reality, however, mammals and birds may forage beyond the boundaries of the exposure areas or the Facility itself. For instance, tree swallows and robins migrate from New Jersey in the autumn and return in the spring (USEPA 1993), reducing the amount of time that could be spent at the Facility. In addition, birds and mammals have a species-specific foraging or home range, which is the distance from their nest or den they will travel to forage for food. Frequently, this area is larger than the exposure area or Facility, which would reduce potential risks to birds and mammals foraging at the Facility.

Modifications made to the food web models incorporate a reduced SUF, where appropriate. For tree swallow and American robin, a SUF of 0.67 is used; assuming birds could forage in the area for 8 months of the year (8/12), but migrate out of the area for the remainder of the year (USEPA 1993). Little brown bat hibernate for approximately 6 months of the year (Davis and Hitchcock 1965); therefore the SUF for the bat was reduced to 0.5.

A mink's home range covers approximately 770 hectares (1,900 acres) (USEPA 1993), which is larger than either aquatic exposure area (Northern Drainage Area ~150 acres; Southern Drainage Area ~250 acres). As such, mink were re-evaluated with an SUF of 0.13 (250/1,900) in the Southern Drainage Area. Likewise, the home range for mallard duck spans approximately 435 hectares (1,075 acres) (USEPA 1993), yielding a SUF of 0.23 (250/1075). Neither mink nor mallard were re-evaluated in the Northern Drainage Area because HQ_{LOAELs} from the EE/ERA (based on conservative assumptions) were less than 1.

The remaining wildlife species modeled have small foraging or home ranges and maintain a SUF of 1.

3.2.2 Dietary Composition

In the EE/ERA, a robin's diet was assumed to consist solely of earthworms. USEPA (1993) and Martin et al. (1951) indicate that the diet of robin consists of both plants and invertebrates. As such, robin was re-evaluated using a modified diet of plants, comprising 62.5% of its diet, and invertebrates, comprising 37.5% of its diet.

In addition, recent data indicate the percentage of soil in robin's diet is higher than that assumed in the EE/ERA (10%), which was based on soil ingestion for a different species, the woodcock. Hansen et al. (2011) concludes that robins consume approximately 20% of soil in their diets, so a soil ingestion rate of 20% was incorporated into the model for robin.

Tree swallows also have a varied diet of aerial insects, seeds and plants. Tree swallows are the only member of the swallow family that also feed on berries when insects are limited. This trait enables tree swallows to overwinter in harsher climates and make early spring returns to their breeding habitat. Beal (1918) found the following results by analyzing stomach contents of adults collected during different seasons at various locations: 80% of diet was animal, 20% vegetable. As such, their dietary composition has been modified to reflect 80% invertebrates and 20% plants (Beal 1918, Robertson et al. 1992).

The remainder of the species maintained the assumed conservative diets, as presented in the EE/ERA.

3.2.3 Bioaccumulation Factors

According to NJDEP Guidance (NJDEP 2015), during the first steps of an EE/ERA, it is assumed that a COPEC is 100% bioavailable to the receptors being evaluated. While this is generally considered to be an overestimation of exposure, it provides a level of certainty if, in turn, the risk characterization identifies no potential ecological risks. However, during later stages of the assessment, bioaccumulation should be considered when calculating levels of exposure, especially in calculations of impacts to upper-trophic level receptors through food web transfer (NJDEP 2015).

To estimate COPEC concentrations in each organism's prey tissue items in the EE/ERA, literature-based uptake factors were incorporated into the food web models. For the terrestrial food web models, bioaccumulation factors (BAFs) were used, in conjunction with soil COPEC concentrations, to estimate tissue COPEC concentrations in plants and earthworms. For the aquatic food web models, biota-sediment accumulation factors (BSAFs) were used, in conjunction with sediment COPEC concentrations, to estimate tissue COPEC concentrations in fish and benthic invertebrates.

3.3 Lead

The EE/ERA identified lead as one of the primary potential risk drivers at the Facility. As a result, the toxicological properties and biouptake of lead were further evaluated to refine the food web models.

3.3.1 Bioaccessibility

The EE/ERA conservatively assumed that COPECs are completely absorbed into an organism's gastrointestinal tract and enter the bloodstream where they can cause adverse effects. Kaufman et al. (2007) provide gastric models for both birds and mammals to evaluate the proportion of lead that mobilizes into the digestive juices (bioaccessible fraction) from soil, earthworms, and vegetation collected at a rifle and pistol range. Results for the avian gastric model suggest that the bioaccessible fraction of lead in soil was 53% and in earthworm tissue was 73% (Kaufman et al. 2007). For the mammalian model, the bioaccessible fraction of lead in soils was 66%, in earthworm tissue was 77%, and in unwashed vegetation was 50% (Kaufman et al. 2007). These bioaccessibility ratios were incorporated into the revised food web models for terrestrial birds and mammals foraging at the Facility.

3.3.2 Toxicity Reference Values

TRVs used in the EE/ERA were obtained from the EcoSSL documents (USEPA 2005) which were conservatively developed. For instance, the form of metal used to dose animals in a laboratory study is frequently the most toxic and most bioavailable form to ensure uptake by the animal. While the form of lead in Facility soils is likely metallic lead, many of the toxicity studies are based upon toxic lead forms such as lead acetate or lead nitrate (USEPA 2005). This adds additional conservatism into the evaluation.

Furthermore, avian toxicity data used in the development of the TRVs include reproduction data for chickens, a domestic bird species with higher rates of reproduction than wild birds. In fact, TRVs recommended by USEPA (2005) for lead are based exclusively on reproduction in chickens. Using revised TRVs based on wild bird data, NOAEL-based TRVs for reproduction range from 0.194 to 125 mg/kg bw/day; LOAEL-based TRVs for reproduction range from 0.11 to 377 mg/kg bw/day, with a geometric mean of 11.4 mg/kg bw/day. Sample et al. (1996) reports a similar LOAEL (11.3 mg/kg bw/day) based on a study of Japanese quail (from Edens et al. 1976). This LOAEL was also used by Kaufman et al. (2007) to evaluate the bioaccessibilty of lead to birds and mammals. Edens et al. (1976) reports a NOAEL of 1.13 mg/kg bw/day for lead. As such, 1.13 and 11.3 mg/kg bw/day will serve as the revised avian TRVs for lead.

For mammals, conservative TRVs used in the EE/ERA are modified from 4.7 to 8 mg/kg bw/day for the NOAEL and from 8.9 to 80 mg/kg bw/day for the LOAEL. These TRVs are reported in Sample et al. (1996) and are based on a study by Azar et al. (1973) using laboratory rats.

3.4 Exposure Areas

Similar to the exposure area evaluation conducted for the EE/ERA, the Facility was separated into one terrestrial and two overall aquatic exposure areas. In this re-evaluation, the two

aquatic exposure areas were subdivided further to identify potential risk drivers and specific aquatic features where observed conditions contribute to potential risk. The evaluation for the terrestrial area remains consistent with the spatial analysis conducted for the EE/ERA; however, species- and site-specific exposure parameters are incorporated into the food web models.

3.4.1 Terrestrial Area

Based on a review of the CSM, historical Facility information, and SI/RI data, several process/disposal areas within the Remedial Area were identified as areas where remedial action is warranted, irrespective of the outcome of the EE/ERA. The locations, composition, and/or constituents present in these areas align with historical Facility practices and records from the Facility (e.g., disposal areas, explosions).

To guide the FS process, these Areas of Presumed Remedial Action were prioritized using a tiered system. Tier ranking prioritizes remediation in areas of the Facility based (in part) on elements such as complexity of the remedy, severity of the effects, duration of remedy implementation, and/or alignment with Facility redevelopment planning. The tiered organization includes the following areas:

- Tier I:
    - TNT Area (conglomerate of adjacent areas of concern)
- Tier II:
    - Ammonium Nitrate Area – Former Burning Ground and intervening areas of concern (H12-237, H13-1, H13-7)
    - B-Line Area – Disposal Area (M8-1)
    - Diazo Area – Diazo Ponds (H8-1)
    - B-Line Area - Dinitrotoluene (DNT) Heater House (L11-2091)
    - Development Area – Old Burning Ground and adjacent areas of concern to the southwest (M5-3, L5-2313, L5-10, L5-2275, L5-539)
- Tier III:
    - Storage Area – Disposal Area (N6-1)
    - B-Line Area – South (conglomerate of adjacent areas of concern)
    - A-Line Area – Northwest (conglomerate of adjacent areas of concern)

Recognizing the pending remedial actions in the Tier I, II, and III areas, data from these areas were not included in the EE/ERA and are excluded from any further evaluation (Figure 2).

3.4.2 Aquatic Areas

The two aquatic exposure areas were re-evaluated using modified exposure parameters described above. For remaining potential risk (i.e., HQ_{LOAELs} greater than 1), discrete subareas of the Northern and Southern Drainage Areas were identified based on geography, drainage

pathways, and hydrological flow characteristics. These subareas were then evaluated individually to identify potential risk drivers by specific area. This evaluation provides information on the areas potentially driving potential risk to focus future sampling efforts.

3.4.2.1 Northern Drainage Area

The Northern Drainage Area was re-evaluated with revised exposure models, based on site- and receptor-specific parameters. Next, the area was divided into five smaller exposure areas (based on drainage characteristics and relationships) to identify contributors to potential risk that may require additional sampling.

Historical sediment data for COPECs identified in the Northern Drainage Area were separated into five smaller exposure areas: Duck Pond, Western Tributary, Eastern Tributary (including Shooting Pond), several Unnamed Ponds, and Northeast Ponds. Exposure point concentrations (EPCs) were calculated based on 95UCLs for each area with sufficient data were available. If an area had less than five detections or if 95UCLs were larger than maximum detected concentrations, average concentrations were used as EPCs. Food web models were re-run with revised exposure parameters and new site-specific EPCs for each area. Data summary statistics for each area and a screen against sediment ESBs is presented in Table 1. Northern Drainage Area and the five exposure areas are presented in Figures 3 through 8. Constituent concentrations in Northern Drainage Area sediment are presented on Figures 19 and 20.

3.4.2.2 Southern Drainage Area

The Southern Drainage Area was re-evaluated with revised exposure models, based on site- and receptor-specific parameters. Next, the area was divided into nine smaller exposure sub areas (based on drainage characteristics and relationships) to identify contributors to potential risk that may require additional sampling: Central Drainage Basin, Development Area, Maintenance Dynamite Area – East, Maintenance Dynamite Area – West, Maintenance – NG Area, Miscellaneous TNT Ponds, Offsite Stream – Lower, Offsite Stream – Upper, and TNT-PETN-NG Ditches.

Historical sediment data for COPECs identified in the Southern Drainage Area were separated by exposure area. EPCs were calculated based on 95UCLs for each area if sufficient data were available. If an area had less than five detections or if 95UCLs were estimated to be larger than maximum detected concentrations, average concentrations were used as EPCs. Food web models were re-run with revised exposure parameters and new site-specific EPCs for each area. Data and summary statistics for each area and a screen against sediment ESBs is presented in Table 2. Southern Drainage Area exposure areas are presented in Figures 9 through 18. Constituent concentrations in Southern Area Drainage sediment are presented on Figures 22 through 26.

3.5 Risk Characterization

The following section describes the results of the revised ecological risk assessment using site- and species-specific exposure parameters.

3.5.1 Terrestrial Area

Using alternative TRVs for mammals provided in the preceding section, lead HQ_{LOAEL} for shrew decrease below the threshold value of 1. HQ_{LOAEL} for total PCBs remains the same.

Using revised site- and species-specific exposure parameters for robin, HQ_{LOAEL} for copper and total PCBs decreases to less than 1. The HQ_{LOAEL} for lead decreases to 3. Lead continues to present potential risks to robin and additional evaluation for robin is likely necessary.

HQ_{LOAELs} from the revised food web models for shrew and robin are summarized below; full models are presented in Tables 3 and 4. Figures 19 and 27 present lead data in the terrestrial area.

	Shrew	**Robin**
Copper	-	≤1
Lead	≤1	**3**
Total PCBs	**2**	≤1

3.5.2 Conceptual Redevelopment Footprint

Certain areas of the Facility are targeted for redevelopment. It is assumed that in the developable areas, some type of soil cap, vegetative cover (e.g., ornamental landscape), or paved/impervious surfaces will exist in the future. Other portions of the Facility, notably the areas abutting on-site wetlands and drainage areas in the Northern and Southern Aquatic Drainage Areas are non-developable. Figure 28 presents a conceptual redevelopment footprint and lead concentrations in non-developable areas.

Soil data in the non-developable areas were used to re-evaluate potential remaining risks from lead to robin. Assuming lead concentrations in the non-developable portions of the Facility remain in surface soil, the terrestrial EPC for lead was recalculated and incorporated into the food web model for robin. Because some terrestrial areas of the Facility remain with elevated lead in soil, the HQ increased slightly (from 3 to 4). Additional remedial actions in the non-developable areas are likely to be necessary to remediate elevated lead concentrations (Figure 27).

3.5.3 Aquatic Areas

HQ_{LOAELs} for the revised evaluation in the Northern and Southern Drainage Areas are summarized below. No changes were made to the food web model for the muskrat; therefore the results provided below are from the EE/ERA. Revised food web models are presented in Tables 5 through 11.

	Tree Swallow	Great Blue Heron	Mallard	Little Brown Bat	Mink	Muskrat
Northern Drainage Area						
Copper	**4**	-	-	≤1	-	-
Lead	**2**	-	-	-	-	-
Southern Drainage Area						
Fluoranthene	≤1	-	-	**3**	-	-
Pyrene	-	-	-	≤1	-	**2**
Copper	**2**	-	-	≤1	-	-
Lead	**41**	**7**	≤1	≤1	≤1	-
Selenium	≤1	-	-	≤1	-	-

In the Northern Aquatic Drainage Area potential risks to tree swallow are limited to copper and lead. Potential risks for little brown bat are unlikely because HQ_{LOAELs} are below 1.

In the Southern Aquatic Drainage Area, after species-specific SUFs for mallard and mink are incorporated into the food web models, HQ_{LOAELs} are less than 1. Selenium HQ_{LOAELs} are below 1, thus no further evaluation related to selenium is required. Fluoranthene, pyrene, copper, and lead yield unacceptable estimates of potential ecological risk for various receptors.

Based on these findings, the following constituents will be evaluated further in aquatic exposure areas:

- Northern Aquatic Exposure Areas: copper, lead
- Southern Aquatic Exposure Areas: fluoranthene, pyrene, copper, lead

3.5.3.1 Northern Aquatic Sub Areas

Tree swallow and muskrat were re-evaluated in the northern aquatic exposure areas for two COPECs. HQ_{LOAELs} that are greater than 1 from revised exposure models for the northern aquatic exposure areas are summarized below and presented in Table 12.

	Tree Swallow
Copper	Duck Pond, Western Tributary, Unnamed Ponds, Northeast Ponds
Lead	Duck Pond, Western Tributary, Unnamed Ponds

3.5.3.2 Southern Aquatic Sub Areas

Great blue heron, tree swallow, and little brown bat were re-evaluated in the southern aquatic exposure areas for three COPECs. HQ_{LOAELs} that are greater than 1 from revised exposure models are summarized below and presented in Tables 13 through 15.

	Great Blue Heron	Tree Swallow	Little Brown Bat	Muskrat
Fluoranthene	-	-	Central Drainage Basin	
Pyrene	-	-	-	Central Drainage Basin
Copper	-	Maintenance-NG Area, Maintenance-Dynamite Area – East, Maintenance-Dynamite Area – West, TNT-PETN-NG Ditches, Central Drainage Basin	-	
Lead	Maintenance-NG Area, TNT-PETN-NG Ditches, Central Drainage Basin, Miscellaneous TNT Ponds	Maintenance-NG Area, Maintenance-Dynamite Area -East, Maintenance-Dynamite Area – West, TNT-PETN-NG Ditches, Miscellaneous Offsite Streams - Upper Central Drainage Basin, Miscellaneous TNT Ponds	-	

The Development Area Stream in the northwestern portion of the Southern Aquatic Area and the Miscellaneous Offsite Streams (lower) that are located south of the loop road can be excluded from further evaluation because COPECs and receptors have HQ_{LOAELs} below 1. Also, samples collected from areas of presumed remedial action are excluded from further evaluation. In addition, six sediment samples in the extreme western portion of the Facility which are included as part of the TNT-PETN-NG Ditches have low detections of COPECs, eliminating the need for additional evaluation in this area (Figure 17).

3.5.4 Summary and Recommendations

Overall, the refined desktop evaluation indicates that potential ecological risks to terrestrial and aquatic wildlife are low. In the terrestrial area, potential risks are driven primarily by lead in soil. In the aquatic areas, potential risks are also driven primarily by metals and are highest in the two drainage basins—the ponds in the Northern Aquatic Area and the Central Drainage Basin in the Southern Aquatic Area. A summary table of the Northern Aquatic Sub Areas and COPECs driving potential risks is provided below. Future sampling events in the Northern Aquatic Drainage Area should focus primarily around Duck Pond, the Unnamed Ponds, and the Western Tributary of Duck Pond.

Summary of Areas for Further Evaluation - Northern Aquatic Sub Areas

COPEC	Duck Pond	Western Tributary	Unnamed Ponds	Northeast Ponds	Eastern Tributary
Copper	X	X	X	X	
Lead	X	X	X		

A summary table of the Southern Aquatic Sub Areas and COPECs driving potential risks is provided below. Future sampling events in the Southern Aquatic Drainage Area should focus around the Central Drainage Basin and several of the ditches/tributaries leading into it.

Summary of Areas for Further Evaluation - Southern Aquatic Sub Areas

	Maint-Dynamite Area West	Maint-NG Area	Maint Dynamite Area East	TNT-PETN-NG	Central Drainage Basin	Misc Offsite Streams Upper	Misc Offsite Streams Lower	Development Area	Misc TNT Ponds
Fluoranthene					X				
Pyrene					X				
Copper	X	X	X	X	X				
Lead	X	X	X	X	X	X			X

Little brown bat and tree swallow have the highest HQs in the aquatic exposure areas. Because both species are aerial insectivores, potential risks are being driven by conservative BSAFs for metals, particularly copper and lead. BSAFs used to estimate tissue concentrations are based on infaunal invertebrates (e.g., worms, bivalve clams) that spend their entire lives buried in the sediment. Aerial insects, on the other hand, spend a small portion of their life-cycle embedded in the sediment as larvae. Recent research shows that metals and PAHs are lost during metamorphosis (Kraus et al. 2014). Therefore, to validate the results of the food web models for little brown bat and tree swallow, adult aerial insects that serve as prey should be collected around both aquatic drainage areas. The insects would be analyzed for PAHs (where necessary) and metals. Analytical results would be used as inputs to the food web models. This reduces the uncertainty in estimating tissue concentrations of prey items and would present more accurate risk estimates.

Furthermore, recent sediment chemistry data for metals and PAHs is warranted in both the Northern and Southern Aquatic Drainage Areas. Much of the PAH and metals data dates back over 10 years and therefore may no longer represent the biologically active zone (i.e., the portion of sediment organisms are actually exposed to). Sediment accumulates over time and what was once considered the surface or top few inches of sediment may now be buried at depth.

Elevated detections of some metals exist in surface water in both Northern and Southern Drainage Areas. The surface water dataset contains both total and dissolved metals from different areas of different waterbodies. In order to have a more consistent dataset, both total and dissolved metals should be collected as needed. This would fill data gaps observed in the surface water dataset. More recent chemistry data may also reveal lower constituent concentrations in surface water.

No additional sampling is proposed for soil in the terrestrial area. Elevated concentrations of lead that remain in surface soil will need to meet human health lead criterion of 600 mg/kg for non-residential use or 400 mg/kg for residential use (NJDEP 2008). Therefore, concentrations of lead that exceed these values will likely be remediated. As such, removal of soils with lead concentrations exceeding human health criteria will also eliminate any potential terrestrial ecological risk.

Section 4: Ecological Investigation – Field Sampling Plan

4.1 Scope Overview

Study objectives include endpoints in both terrestrial and aquatic habitats at the Facility. Field sampling activities outlined below include surface water, sediment and aerial insect sampling to address aquatic endpoints. Terrestrial endpoints will be evaluated following refinement of redevelopment areas at the Facility as outlined below.

4.2 Terrestrial Exposure Area

Several process/disposal areas within the Remedial Area were identified as areas where remedial action is warranted, irrespective of the outcome of the EE/ERA, and certain areas of the Facility are targeted for redevelopment as residential, retail, and/or industrial facilities. Additional remedial actions in the non-developable areas may occur to remediate elevated lead concentrations. Additional ecological sampling activities in the terrestrial exposure area will be proposed following the refinement of redevelopment areas and areas where remedial action is warranted. Additional ecological sampling will help to develop the final remedy for the terrestrial exposure area, which will be protective of human health as well as ecological receptors and be least disruptive to existing ecological function.

4.3 Aquatic Exposure Areas

The two aquatic exposure areas were re-evaluated using updated exposure parameters. For remaining potential risk (i.e., HQs greater than 1), exposure areas of the Northern and Southern Aquatic Drainage Areas were identified based on geography, drainage pathways, and hydrological flow characteristics. Next, each exposure area was evaluated individually to identify potential risk drivers. This evaluation provided information on the areas potentially driving risk to focus sampling efforts.

4.3.1 Rational and Data Use Objectives

Results of the revised risk evaluation using more site- and species-specific exposure parameters identified COPECs with HQs greater than 1. These COPECs are targeted for additional sampling to understand potential risk estimates. Specifically, additional chemistry data will be collected on surficial sediment samples and in aerial insect tissues to provide current and site-specific inputs for the food web models. Acid volatile sulfide and simultaneously extracted metals (AVS/SEM) will also be conducted on surficial sediment samples to evaluate the potential bioavailability of the metals. Surface water will be collected for COPECs with historically elevated concentrations or in areas where minimal or incomplete data were collected. The following sections outline sample location selection and type per sub area.

4.3.1.1 Northern Drainage Area Sampling Locations

4.3.1.1.1 Duck Pond

Upper trophic level hazard quotients based on lowest observed effects levels (HQ_{LOAEL}) for copper and lead were greater than 1 for the tree swallow in Duck Pond. Aerial insect tissue data will be collected for copper and lead to evaluate potential risk to the tree swallow. Two light trap sample locations proposed for Duck Pond are shown on Figure 4.

4.3.1.1.2 Western Tributary

Upper trophic level hazard quotients based on lowest observed effects levels (HQ_{LOAEL}) for copper and lead are greater than 1 for the tree swallow in the Western Tributary. Aerial insect tissue data will be collected for copper and lead to evaluate potential risk to the tree swallow. Four light trap sample locations proposed for the Western Tributary are shown on Figure 5.

The surface water dataset for the Western Tributary contained areas that were sampled for total metals and dissolved metals separately. Additional surface water data will be collected to analyze for both total and dissolved metals along with general chemistry parameters (pH, hardness and total suspended solids). Ten surface water sample locations proposed for the Western Tributary are shown on Figure 5.

4.3.1.1.3 Unnamed Ponds

Hazard quotients based on benthic severe effects levels (HQ_{SELs}) are greater than 1 for arsenic, mercury, lead and zinc. Additional sediment chemistry data will be collected for metals with HQ_{SELs} above 1 as well as AVS/SEM to evaluate current concentrations and bioavailability. Additionally, methylmercury (MeHg) will be analyzed in sediment samples collected for mercury. Five sediment sample locations proposed for the Unnamed Ponds are shown on Figure 7.

Upper trophic level hazard quotients based on lowest observed effects levels (HQ_{LOAEL}) for copper and lead were greater than 1 for the tree swallow in the Unnamed Ponds. Aerial insect tissue data will be collected for copper and lead to evaluate potential risk to the tree swallow. Two light trap sample locations proposed for the Unnamed Ponds are shown on Figure 7.

The surface water dataset for the Unnamed Ponds does not contain any dissolved metals data. Additional surface water data will be collected to analyze for both total and dissolved metals along with general chemistry parameters (pH, hardness and total suspended solids). Additionally, MeHg will be analyzed in surface water samples collected for mercury. Five surface water sample locations proposed for the unnamed ponds are shown on Figure 7.

4.3.1.1.4 Northeast Ponds

The upper trophic level hazard quotient based on lowest observed effects levels (HQ_{LOAEL}) for copper is greater than 1 for the tree swallow in the Northeast Ponds. Aerial insect tissue data will be collected for copper to evaluate potential risk to the tree swallow. One light trap sample location proposed for the Northeast Ponds is shown on Figure 8.

4.3.1.2 Southern Drainage Area Sampling Locations

4.3.1.2.1 Central Drainage Basin

Hazard quotients based on benthic severe effects levels (HQ_{SELs}) are greater than 1 for several PAHs (acenaphthene, acenaphthylene, fluorene, naphthalene, and phenanthrene), lead, and mercury. Sediment chemistry data will be collected for PAHs and metals with HQ_{SELs} above 1, along with AVS/SEM to evaluate current concentrations and bioavailability. Additionally, MeHg will be analyzed in sediment samples collected for mercury. Ten sediment sample locations proposed for the central drainage basin are shown on Figure 10.

Upper trophic level hazard quotients based on lowest observed effects levels (HQ_{LOAEL}) for copper and lead are greater than 1 for the tree swallow and for fluoranthene in little brown bat in the Central Drainage Basin. Aerial insect tissue data will be collected for fluoranthene, copper, and lead to evaluate potential risk to the tree swallow and little brown bat. Two light trap sample locations proposed for the central drainage basin are shown on Figure 10.

4.3.1.2.2 Maintenance-Dynamite Area – West

The hazard quotient based on benthic severe effects level (HQ_{SEL}) is greater than 1 for mercury in the Maintenance-Dynamite Area-West. Additional sediment chemistry data will be collected for mercury along with MeHg and AVS/SEM to evaluate current concentrations and bioavailability. Five sediment sample locations proposed for the Maintenance-Dynamite Area-West are shown on Figure 11.

Upper trophic level hazard quotients based on lowest observed effects levels (HQ_{LOAEL}) for lead and copper are greater than 1 for the tree swallow in the Maintenance-Dynamite Area-West. Aerial insect tissue data will be collected for lead and copper to evaluate potential risk to the tree swallow. Two light trap sample locations proposed for the Maintenance-Dynamite Area-West are shown on Figure 11.

The surface water dataset for the Maintenance-Dynamite Area-West contained concentrations of total lead, copper and mercury. Additional surface water data will be collected to analyze for both total and dissolved lead, copper and mercury along with general chemistry parameters (pH, hardness and total suspended solids). Additionally, MeHg will be analyzed in surface water samples collected for mercury. Five surface water sample locations proposed for the Maintenance-Dynamite Area-West are shown on Figure 11.

4.3.1.2.3 Maintenance-Dynamite Area – East

Upper trophic level hazard quotients based on lowest observed effects levels (HQ_{LOAEL}) for copper and lead are greater than 1 for the tree swallow in the Maintenance-Dynamite Area-East. Aerial insect tissue data will be collected for copper and lead to evaluate potential risk to the tree swallow. Three light trap sample locations proposed for the Maintenance-Dynamite Area-East are shown on Figure 12.

The surface water dataset for the Maintenance-Dynamite Area-East contains concentrations of total lead and copper. Additional surface water data will be collected to analyze for both total and dissolved lead and copper along with general chemistry parameters (pH, hardness and total suspended solids). Five surface water sample locations proposed for the Maintenance-Dynamite Area-East are shown on Figure 12.

4.3.1.2.4 Miscellaneous Offsite Streams – Upper

The hazard quotient based on benthic severe effects level (HQ_{SEL}) is greater than 1 for lead in the Miscellaneous Offsite Streams - Upper. Additional sediment chemistry data will be collected for lead along with AVS/SEM to evaluate current lead concentrations and bioavailability. Five sediment sample locations proposed for the Miscellaneous Offsite Streams-Upper are shown on Figure 13.

The upper trophic level hazard quotient based on lowest observed effects levels (HQ_{LOAEL}) for lead is greater than 1 for the tree swallow in the Miscellaneous Offsite Streams - Upper sub area. Aerial insect tissue data will be collected for lead to evaluate potential risk to the tree swallow. One light trap sample location proposed for the Miscellaneous Offsite Streams - Upper is shown on Figure 13.

4.3.1.2.5 Maintenance-NG Area

Hazard quotients based on benthic severe effects level (HQ_{SEL}) are greater than 1 for mercury, copper and lead in the Maintenance-NG Area. Sediment chemistry data will be collected for metals with HQ_{SELs} above 1 along with AVS/SEM to evaluate current concentrations and bioavailability. Additionally, MeHg will be analyzed in sediment samples collected for mercury. Five sediment sample locations proposed for the Maintenance-NG Area are shown on Figure 15.

Upper trophic level hazard quotients based on lowest observed effects levels (HQ_{LOAEL}) for copper and lead are greater than 1 for the tree swallow in the Maintenance-NG Area. Aerial insect tissue data will be collected for copper and lead to evaluate potential risk to the tree swallow. One light trap sample location proposed for the Maintenance-NG Area is shown on Figure 15.

4.3.1.2.6 TNT-PETN-NG Ditches

Hazard quotient based on benthic severe effects level (HQ_{SEL}) are greater than 1 for mercury, arsenic and lead in the TNT-PETN-NG Ditches. Additional sediment chemistry data will be collected for metals with HQ_{SELs} above 1, along with AVS/SEM to evaluate current concentrations and bioavailability. Additionally, MeHg will be analyzed in sediment samples collected for mercury. Five sediment sample locations proposed for the TNT-PETN-NG Ditches are shown on Figure 17.

Upper trophic level hazard quotients based on lowest observed effects levels (HQ_{LOAEL}) for copper and lead are greater than 1 for the tree swallow in the TNT-PETN-NG area ditches sub area. Aerial insect tissue data will be collected for copper and lead to evaluate potential risk to the tree swallow. One light trap sample location proposed for the TNT-PETN-NG area ditches is shown on Figure 17.

4.3.1.2.7 Miscellaneous TNT Ponds

The hazard quotient based on benthic severe effects level (HQ_{SEL}) is greater than 1 for lead in the Miscellaneous TNT Ponds. Additional sediment chemistry data will be collected for metals with HQ_{SELs} above 1, along with AVS/SEM to evaluate current concentrations and bioavailability. Three sediment sample locations proposed for the Miscellaneous TNT Ponds are shown on Figure 18.

4.4 Sampling Methods

4.4.1 Surface Water Sampling

Surface water sampling will be conducted in accordance with NJDEP Field Sampling Procedures Manual (FSPM) (NJDEP 2005) and will include surface water sample collection via bottle transfer or bacon bomb sampler. Locations will be sampled at six inches above the sediment surface. If insufficient water (less than 3 inches) or habitat for aquatic life is present, a surface water sample will not be collected.

Surface water sampling locations will be accessed by land working from the most downstream location to upstream. A handheld GPS unit will be used to record each sampling location. Horizontal coordinates will be referenced in feet to the North American Datum of 1983 New Jersey State Plane Coordinate System. Prior to sample collection, *in-situ* water quality parameters will be recorded from six inches above the sediment surface at each sample location if standing water is present. *In-situ* parameters include temperature, pH, dissolved oxygen, oxidation-reduction potential, turbidity, conductivity, and salinity. A combination water quality meter will be lowered to the appropriate depth and allowed to equilibrate prior to recording the readings in the field notebook.

Water depth will be measured and recorded at each surface water sampling location. Surface water samples will be collected and submitted to Eurofins Lancaster Laboratories Environmental (Eurofins) in Lancaster, PA, a New Jersey Environmental Laboratory Accreditation Program (NJELAP)-accredited laboratory. Surface water samples will be analyzed for metals, pH, hardness and total suspended solids using USEPA Methods 6020A, 5310C, 9040C, 130.2 and 160.2, respectively.The laboratory will prepare “reduced” laboratory data packages as required per N.J.A.C. 7:26E-2.1(a)16.ii.

Quality Assurance/Quality Control (QA/QC) samples will include the collection of one field blank taken at the conclusion of each sampling day, one blind duplicate sample per twenty samples, and one matrix spike/matrix spike duplicate (MS/MSD) sample per twenty samples.

4.4.2 Sediment Sampling

Sediment sampling will be conducted in accordance with the current NJDEP FSPM (NJDEP 2005). Sediment samples will be collected from 0-0.5 feet (ft) below ground surface. Locations will be sampled for chemical and physical parameters at the 0-0.5 ft depth, to characterize chemical concentrations and bioavailability in sediment.

Sediment sampling locations will be accessed by land working from the most downstream location to upstream. A handheld GPS unit will be used to record each sampling location. Horizontal coordinates will be referenced in feet to the North American Datum of 1983 New Jersey State Plane Coordinate System. Prior to sample collection, *in-situ* water quality parameters will be recorded from six inches above the sediment surface at each sample location if standing water is present. *In-situ* parameters include temperature, pH, dissolved oxygen, oxidation-reduction potential, turbidity, conductivity, and salinity. A combination water quality meter will be lowered to the appropriate depth and allowed to equilibrate prior to recording the readings in the field notebook.

Sediment samples will be collected by driving polycarbonate tubing to desired collection depth using manual techniques (i.e., hand-held slide hammer). If the polycarbonate tubes do not appear to be collecting adequate sample volume, then other sampling methods may be used (i.e., hand auger, piston core sampler or sample tubes with a check valve attachment). At each sediment sampling location, water depth and sediment core recovery will be measured and recorded. Following sediment core collection, the cores will processed at a staging area set up on or adjacent to the Facility. A new polycarbonate tube will be used at each sample location.

Excess material from the sediment core samples and other investigative-derived waste (IDW) will be containerized and sampled for subsequent characterization and disposal.

Sediment samples will be submitted to Eurofins in Lancaster, PA, a NJELAP-accredited laboratory. Sediment samples will be analyzed for metals, PAHs, pH, TOC, AVS/SEM and grain size using USEPA Methods 6020A, 8272, 9040C, 5310C, and 6020A, and ASTM International Method D422, respectively. The laboratory will prepare “reduced” laboratory data packages as required per N.J.A.C. 7:26E-2.1(a)16.ii.

QA/QC samples will include the collection of one field blank taken at the conclusion of each sampling day, one blind duplicate sample per twenty samples, and one MS/MSD sample per twenty samples.

4.4.3 Ultraviolet Light Traps

Ultraviolet (UV) light traps are a standard technique for the collection of aerial adult insects. The traps are commercially available and the method is widely used as a means of collecting adult and emergent stream insects (HRNRT 2009). The light trap is a fluorescent light fixture combined with a funnel which collects and traps the insects. Deployed at night, the ultraviolet light attracts night-flying insects, and they fall into the funnel.

Aerial insects will be collected from the targeted water bodies at the Facility using UV light traps beginning at dusk over the course of one evening at each location. If poor weather (i.e., storms, high wind) affects the collection effort, a second night during more favorable weather may be scheduled. One light trap will be set up at each sample location and will be allowed to run continuously from dusk to dawn. At the end of the night, the traps will be emptied and the collected insects will be preserved on ice for tissue analysis.

Tissue samples will be submitted to Eurofins in Lancaster, PA, a NJELAP-accredited laboratory. Tissue samples will be analyzed for metals and PAHs using USEPA Methods 6020A and 8272, respectively. The laboratory will prepare “reduced” laboratory data packages as required per N.J.A.C. 7:26E-2.1(a)16.ii.

QA/QC samples will include the collection of one field blank taken at the conclusion of each sampling day and one MS/MSD sample per twenty samples.

4.5 Schedule and Reporting

Field sampling activities will occur in June 2016. Following receipt of results from Eurofins, K/J will prepare an ERA Addendum to be submitted to the LSRP by December 2016. The ERA

addendum will summarize the results of the field sampling efforts, refine risk models and provide additional recommendations for sampling or remedy as needed.

Re: Former Kenvil Works Facility

Dear Ms. Salisbury:

Thank you for your data request regarding rare species information for the above referenced project site in Roxbury Township, Morris County.

Searches of the Natural Heritage Database and the Landscape Project (Version 3.1) are based on a representation of the boundaries of your project site in our Geographic Information System (GIS). We make every effort to accurately transfer your project bounds from the topographic map(s) submitted with the Request for Data into our Geographic Information System. We do not typically verify that your project bounds are accurate, or check them against other sources.

We have checked the Landscape Project habitat mapping and the Biotics Database for occurrences of any rare wildlife species or wildlife habitat on the referenced site. The Natural Heritage Database was searched for occurrences of rare plant species or ecological communities that may be on the project site. Please refer to Table 1 (attached) to determine if any rare plant species, ecological communities, or rare wildlife species or wildlife habitat are documented on site. A detailed report is provided for each category coded as 'Yes' in Table 1.

We have also checked the Landscape Project habitat mapping and Biotics Database for occurrences of rare wildlife species or wildlife habitat in the immediate vicinity (within ¼ mile) of the referenced site. Additionally, the Natural Heritage Database was checked for occurrences of rare plant species or ecological communities within ¼ mile of the site. Please refer to Table 2 (attached) to determine if any rare plant species, ecological communities, or rare wildlife species or wildlife habitat are documented within the immediate vicinity of the site. Detailed reports are provided for all categories coded as 'Yes' in Table 2. These reports may include species that have also been documented on the project site.

The Natural Heritage Program reviews its data periodically to identify priority sites for natural diversity in the State. Included as priority sites are some of the State's best habitats for rare and endangered species and ecological communities. Please refer to Tables 1 and 2 (attached) to determine if any priority sites are located on or in the vicinity of the site.

A list of rare plant species and ecological communities that have been documented from Morris County can be downloaded from http://www.state.nj.us/dep/parksandforests/natural/heritage/countylist.html. If suitable habitat is present at the project site, the species in that list have potential to be present.

Status and rank codes used in the tables and lists are defined in EXPLANATION OF CODES USED IN NATURAL HERITAGE REPORTS, which can be downloaded from http://www.state.nj.us/dep/parksandforests/natural/heritage/nhpcodes_2010.pdf.

If you have questions concerning the wildlife records or wildlife species mentioned in this response, we recommend that you visit the interactive NJ-GeoWeb website at the following URL, http://www.state.nj.us/dep/gis/geowebsplash.htm or contact the Division of Fish and Wildlife, Endangered and Nongame Species Program at (609) 292-9400.

PLEASE SEE 'CAUTIONS AND RESTRICTIONS ON NHP DATA', which can be downloaded from http://www.state.nj.us/dep/parksandforests/natural/heritage/newcaution2008.pdf.

Thank you for consulting the Natural Heritage Program. The attached invoice details the payment due for processing this data request. Feel free to contact us again regarding any future data requests.

Sincerely,

Robert J. Cartica
Administrator

RE: Alliant Techsystems Inc
100 Howard Blvd
Roxbury Twp, Morris County
SRP PI# 000741
LSR120001

Dear Mr. Edward Meeks:

On 12/21/23, the Department received your "Remedial Timeframe Notification Form" requesting an extension to a mandatory time frame (MTF). The Administrative Requirements for the Remediation of Contaminated Sites (ARRCS) rules at N.J.A.C. 7:26C-3.3(d) and 3.5 list the requirements which must be met for approval of an MTF extension requests upon submission to the Department. Those rules also indicate that the Department may deny an extension request.

The Department has considered your request and hereby **approves** the MTF extension for the submittal of the Remedial Action Report to 5/6/29.

Be advised that if the permit application is not administratively and technically complete and a MTF date is missed, the Site is immediately subject to the direct oversight requirements at N.J.A.C. 7:26C-14.2(b) and shall comply with all requirements.

Should you have any questions please contact the Bureau of Case Assignment and Initial Notice Duty Officer at 609-292-2943.

Sincerely,

Kirstin Hahn

REMEDIAL TIMEFRAME NOTIFICATION FORM

☒ Extension Request
☐ Lengthen Remedial Investigation Report (RIR) Timeframe Notification
☐ Contaminated Media Notification

Date Stamp
(For Department use only)

SECTION A. SITE NAME AND LOCATION

Site Name: Former Kenvil Works Facility

List all AKAs: Alliant Techsystems Inc.

Street Address: 100 Howard Blvd.

Municipality: Roxbury Township (Township, Borough or City)

County: Morris Zip Code: 07847

Program Interest (PI) Number(s): 000741

Case Tracking Number(s) for this submission: 849

SECTION B. NJDEP CASE MANAGER

Do you have an assigned Case Manager? ..... ☐ Yes ☒ No

If "Yes," please list the Case Manager: _____

SECTION C. EXTENSION REQUEST

(Complete this section only if you are filing an extension request)

An extension is requested to the regulatory timeframe pursuant to NJAC 7:26C-3.2(b) or the mandatory or site-specific timeframe pursuant to NJAC 7:26C-3.5 as follows:

Report Type	Current Regulatory Timeframe	Proposed Regulatory Timeframe**	Current Mandatory or Expedited Site-Specific Timeframe	Proposed Mandatory or Expedited Site Specific Timeframe
Initial Receptor Evaluation*				
Preliminary Assessment Report*				
Site Investigation Report*				
Remedial Investigation Report*				
Remedial Action Report*	05/06/2024	12/18/2034	05/06/2024	12/18/2034
LNAPL Interim Remedial Measures Report*				
Immediate Environmental Concern Engineered System Response Action Report				
Immediate Environmental Concern Source Control Report*				
Other (write in):				
Other (write in):				
Other (write in):				

* This report has a mandatory remediation timeframe
** This date cannot exceed the mandatory remediation timeframe.

Note: Extensions to the regulatory timeframe are deemed approved provided the requirements of N.J.A.C. 7:26C-3.2(b) are met. If these requirements are not met, the NJDEP will notify the requestor in writing the extension is denied.

Justification for Extension

1. Describe the cause or causes of the need for additional time to complete the work:

TThe Kenvil Works Facility (Facility) spans 1,059 acres with more than 1,100 areas of concern (AOCs). The scale, complexity, and cost of the remedial actions required to close the site requires work that will extend beyond the May 2024 mandatory timeframe established by NJDEP. A series of large-scale, multi-year remedial actions (e.g., TNT bioremediation, Development Area capping) are underway that will address close to 70 percent of the Facility's AOCs. While current efforts are prioritized in these areas, Hercules has developed a sequence and estimated schedule for the remainder of the AOCs necessary to achieve site closure. Hercules anticipates having engineering and institutional controls, Remedial Action Permits (RAPs), and Response Action Outcomes (RAOs) in place sitewide in 2034.

2. Describe in detail the steps taken to minimize the additional time needed to complete the work:

(For any site where access is a cause of the need for additional time to complete the work, detail the steps taken to obtain access)

Hercules has prioritized, and has begun implementing, a series of complex, multi-year remedies. Hercules has sequenced additional remedial planning (pre-design investigations) for successive remedial actions. Hercules continues to focus on large-scale remedies that address multiple AOCs concurrently (e.g., capping and redevelopment). The TNT bioremediation and Development Area capping remedies discussed in the supplemental narrative are examples of ongoing large-scale remedies that will result in the closure of multiple AOCs.

3. Additional information:

Please see supplemental narrative (Exhibit A) and project schedule (Exhibit B) appended to the form for additional details related to the completed and in-progress remedies noted above, as well as a prioritized list of forthcoming remedial actions that will move the Facility through the Remedial Action Report (RAR) and RAP/RAO processes for sitewide closure.

SECTION D. CONTAMINATED MEDIA NOTIFICATION (to Adjust RI/RA Regulatory Timeframes)

(Complete this section only when notifying the NJDEP of the discovery of contamination in any media other than soil.)

Contamination was discovered in:

- ☐ Ground Water Date: _____
- ☐ Sediment Date: _____
- ☐ Surface Water Date: _____

For sites not subject to N.J.S.A. 58:10C-27 wherein the remedial investigation must be completed by May 7, 2014, checking any box will increase the regulatory timeframe to complete the remedial investigation and remedial action from 3 years to 5 years and requires the Annual Remediation Fee Form be updated via the NJ Portal pursuant to N.J.A.C 7:26C-4.3(e).

SECTION E. LENGTHEN RIR TIMEFRAME NOTIFICATION

(Complete this section only if you are lengthening the Remedial Investigation Report Regulatory Timeframe)

1. Is the request for an Industrial Establishment subject to ISRA? ..... ☐ Yes ☐ No
2. Indicate the number of additional years requested beyond the initial Remedial Investigation Report Regulatory Timeframe due date. Number of Years: _____ (Maximum of 4 years)
3. The initial Remedial Investigation Report Regulatory Timeframe Due Date: ..... _____
4. The revised Remedial Investigation Report Regulatory Timeframe Due Date: ..... _____
5. Justification (check all that apply)
   - ☐ Access to real property not owned or controlled by the person responsible for conducting the remediation is required, or contamination has impacted an environmentally sensitive natural resource, as defined in N.J.A.C. 7:26E-1.8.
   - ☐ Ground water contamination exists in a consolidated aquifer or a dense non-aqueous phase liquid exists in ground water.
   - ☐ Ground water contamination exists in more than one aquifer or there are two or more distinct ground water contaminant plumes.
   - ☐ The person responsible for conducting the remediation wants a final remediation document for the entire site, the discharge was not discovered prior to May 7, 1999, and the site does not include an industrial establishment that the owner or operator are required to remediate pursuant to the Industrial Site Recovery Act, N.J.S.A. 13:1K-6 et seq., and the Industrial Site Recovery Act rules, N.J.A.C. 7:26B.

SECTION F. LICENSED SITE REMEDIATION PROFESSIONAL INFORMATION AND STATEMENT

LSRP ID Number: 575011

First Name: Caryn Last Name: Barnes

Phone Numbers: (215) 845-8911 Ext.: Fax:

Mailing Address: 300 Kimball Drive, 4th Floor

Municipality: Parsippany State: NJ Zip Code: 07054

Email Address: cbarnes@langan.com

This statement shall be signed by the LSRP who is submitting this notification in accordance with N.J.S.A. 58:10C-14, and N.J.S.A. 58:10B-1.3b(1) and (2).

(1) I certify, as a Licensed Site Remediation Professional authorized pursuant to N.J.S.A. 58:10C-1 et seq. to conduct business in New Jersey, that for the remediation described in this submission, and all attachments included in this submission, I personally: Managed, supervised, or performed the remediation conducted at this site that is described in this submission, and all attachments included in this submission; and/or periodically reviewed and evaluated the work performed by other persons that forms the basis for the information in this submission; and/or completed the work of another site remediation professional, licensed or not, after having: (1) reviewed all available documentation on which I relied; (2) conducted a site visit and observed the then-current conditions and verified the status of as much of the work as was reasonably observable; and (3)concluded, in the exercise of my independent professional judgment, that there was sufficient information upon which to complete any additional phase of remediation and prepare workplans and reports related thereto.

(2) I certify:

- *That I have read this submission and all attachments to this submission;*
- *That in performing the professional services as the licensed site remediation professional for the entire site or each area of concern, I adhered to the professional conduct standards and requirements governing licensed site remediation professionals provided in N.J.S.A. 58:10C-16;*
- *That the remediation conducted at the entire site or each area of concern, that is described in this submission and all attachments to this submission, was conducted pursuant to and in compliance with the remediation requirements in N.J.S.A. 58:10C-14.c;*
- *That the remediation described in this submission, and all attachments to this submission, was conducted pursuant to and in compliance with the regulations of the Site Remediation Professional Licensing Board at N.J.A.C. 7:26I; and*
- *That the information contained in this submission and all attachments to this submission is true, accurate, and complete.*

(3) I certify, when this submission includes a response action outcome, that the entire site or each area of concern has been remediated in compliance with all applicable statutes, rules, and regulations and is protective of public health and safety and the environment.

(4) I certify that no other person is authorized or able to use any password, encryption method, or electronic signature that the Board or the Department have provided to me.

(5) I certify that I understand and acknowledge that:

- *If I knowingly make a false statement, representation, or certification in any document or information I submit to the Department I may be subject to civil and administrative enforcement pursuant to N.J.S.A. 58:10C-17.a.1(a)through (f) by the Board, including but not limited to license suspension, revocation, or denial of renewal; and*
- *If I purposely, knowingly, or recklessly make a false statement, representation, or certification in any application, form, record, document or other information submitted to the Department or required to be maintained pursuant to the Site Remediation Reform Act, I shall be guilty, upon conviction, of a crime of the third degree and shall, notwithstanding the provisions of subsection b. of N.J.S.2C:43-3, be subject to a fine of not less than $5,000 nor more than $75,000 per day of violation, or by imprisonment, or both.*

(6) I certify that I have read this certification prior to signing, certifying, and making this submission.

LSRP Signature: Date: 12/14/2023

LSRP Name: Caryn Barnes

Company Name: Langan Engineering and Environmental Services, Inc.

SECTION G. PERSON RESPONSIBLE FOR CONDUCTING THE REMEDIATION INFORMATION AND CERTIFICATION

Full Legal Name of the Person Responsible for Conducting the Remediation: Hercules LLC

Representative First Name: Edward Representative Last Name: Meeks

Title: Senior Manager - Remediation

Phone Number: (302) 383-5939 Ext.: FAX:

Mailing Address: 500 Hercules Road, Building 8145

Municipality: Wilmington State: DE Zip code: 09808

Email Address: edmeeks@ashland.com

This certification shall be signed by the person responsible for conducting the remediation who is submitting this notification in accordance with Administrative Requirements for the Remediation of Contaminated Sites rule at N.J.A.C. 7:26C-1.5(a).

I certify under penalty of law that I have personally examined and am familiar with the information submitted herein, including all attached documents, and that based on my inquiry of those individuals immediately responsible for obtaining the information, to the best of my knowledge, I believe that the submitted information is true, accurate and complete. I am aware that there are significant civil penalties for knowingly submitting false, inaccurate or incomplete information and that I am committing a crime of the fourth degree if I make a written false statement which I do not believe to be true. I am also aware that if I knowingly direct or authorize the violation of any statute, I am personally liable for the penalties.

Signature: Edward D Meeks Date: 12/11/2023

Name/Title: Edward D. Meeks, Senior Manager - Remediation

PO Box 420
Trenton, NJ 08625-0420

Overview: Remedial Timeframes

In compliance with the Site Remediation Reform Act and enabling regulations and guidance, Hercules LLC (Hercules), the Person Responsible for Conducting Remediation (PRCR) for the Kenvil Facility (Facility, Program Interest No. 000741), has:

- Submitted an initial Receptor Evaluation (RE) in 2011,
- Retained a Licensed Site Professional in 2012,
- Applied for and received an extension of the Remedial Investigation regulatory timeframe from May 7, 2014 to May 7, 2016, and
- Submitted the Phase II Remedial Investigation Report, including an updated RE, on May 4, 2016 (RIR, Hercules 2016); submission established a Remedial Action regulatory timeframe of May 6, 2021.
- Applied for and received a 2-year extension of the Remedial Action regulatory timeframe from May 6, 2021 to May 6, 2023; this timeframe was further extended to May 6, 2024 by Executive Order 103.

The RIR included an Ecological Evaluation (EE)/Ecological Risk Assessment (ERA), as well as an ERA work plan (ERAWP) to refine areas and constituents identified in the ERA. Subsequent ecological risk assessment activities occurred between 2016 and 2019 per the ERAWP, culminating in a technical consultation with NJDEP in December 2019. Given the pending development at that time and resulting widespread changes to receptor pathways and exposure areas, NJDEP and Hercules agreed to forego supplemental risk assessment activities necessary to refine areas considered for remediation and establish ecological-based remediation goals in areas of the Facility subject to remedial capping remedy integrated with redevelopment (See Development Area Capping below).

Concurrent with the submission of the RIR, Hercules actively began positioning the property for an integrated approach to remediation and redevelopment. Complex, multi-year remedies in areas of the Facility beyond those available for development were also initiated. These large remedies often required focused, pre-design activities necessary to support remedy selection and development. Hercules has spent approximately $55 million since 2000 on the investigation and remediation of the Facility, with nearly $20 million spent since submission of the RIR in 2016. An overview of completed and in-progress remediation projects at the Facility, spanning the current remedial timeframe, is provided below. A schedule (Exhibit B) provides an estimated timeline for completion of in-progress and forthcoming remedies necessary to complete the Remedial Action Report (RAR)/Remedial Action Permit (RAP)/Response Action Outcome (RAO) process and achieve site closure.

TNT Soil Bioremediation

Hercules, acknowledging the complexity and scale of the remedy, initiated study and design activities for a 2,4,6-trinitrotoluene (TNT) soil bioremediation remedy in 2013 prior to finalizing the RIR. This large-scale remedy is underway and will take place over the next decade. At this

estimated duration, the TNT remedy will define the schedule to attain the Remedial Action timeframe for the Facility.

Following the 2013 activities, bench-scale and field pilot studies occurred between 2014 and 2016, followed by design verification studies in 2017 to inform the engineering design of the multi-phase remediation project that relies on physical, chemical, and biological processes to degrade TNT mass in soil. With a remedial approach in place, Hercules focused on refining the Site Investigation/Remedial Investigation (SI/RI) delineation of TNT in soil to define the volume of soil requiring remediation in 2018 and identifying land use constraints proximate to the project area. In 2019, Hercules led a technical consultation with NJDEP Site Remediation Program staff to discuss the remedy, remedial objectives, and timeline. In follow up to the technical consultation, Hercules prepared and submitted the TNT Soil Bioremediation Remedial Action Work Plan (RAWP) (Hercules 2020) detailing the remedial action to degrade TNT (and degradates) constituent mass in approximately 100,000 tons of soil. Permits and approvals were applied for and obtained in 2021. Hercules evaluated, selected, and contracted an environmental services contractor in 2021 to prepare the site and implement the remedy. Remedial construction began in 2021 and was completed in fall 2023. Wet testing of the processing system occurred in fall 2023 and initial soil processing activities are scheduled for the first quarter of 2024.

Hercules designed the TNT soil bioremediation project to occur within the known footprint of the TNT groundwater plume. Given this constraint and the limited availability of flat upland areas in the valley, the remedy will occur in annual cycles, with sufficient space to bioremediate approximately 20,000T of soil each annual cycle, and the entire 100,000T volume remediated over approximately 5 years. Hercules has spent approximately $15 million to date on TNT Area remediation.

In 2029, following the estimated 5 years of annual treatment cycles and backfilling of excavation areas, long term monitoring will begin to document the continued degradation of residuals in soil under in-situ conditions and the anticipated reduction in constituent concentrations in groundwater over time absent a constituent source in soil. Long term monitoring of soil is expected to occur over 5 years (2029 through 2033), with groundwater monitoring to support a monitored natural attenuation (MNA) remedy occurring concurrent with this phase of soil monitoring. Hercules anticipates submitting a TNT Area RAR, updated CEA, and groundwater RAP application in 2034. The RAR/RAP process associated with the TNT remedy is the longest lead-time item shown on the schedule (Exhibit B) and drives the duration of this extension request.

Development Area Capping

Despite ceasing operations as an industrial manufacturing facility more than 25 years ago, the property retains an intrinsic commercial value and garners significant interest from developers. In 2020, Hercules participated in a technical consultation with NJDEP to contemplate regulatory closure via large-scale capping via various conceptual redevelopment scenarios. Shortly thereafter, Hercules began collaborating with Hartz Mountain Industries (Hartz) to integrate consolidation and remedial capping with the proposed development of approximately 200 acres of the property (Development Area) and remediation of and future public access to other portions of the site (Remediation Area). Hercules has prioritized remediation of the Development Area, both in support of the ongoing development activities, and in support of remedial goals. The

Development Area makes less than 20 percent of the areal extent of the site, but contains approximately 50 percent of the areas of concern (AOCs) identified at the Facility. As such, consolidation and capping via development achieves significant progress toward sitewide RAR/RAP/RAO and AOC closure. In addition, more than half of the Development Area is underlain by mapped historic fill material, where capping is the presumptive remedy (irrespective of redevelopment). In 2022, Hercules submitted the Development Area Soil Capping RAWP (Hercules 2022a) to NJDEP for the remedial capping of the approximately 200-acre portion of the property associated with Hartz's development plan.

Hercules' recent remedial efforts in the Development Area focused on addressing conditions that require remediation to facilitate a capping remedy. The polychlorinated biphenyl (PCB) Remediation and Concrete Management activities (discussed separately below) represent two of these efforts. Additional in progress and forthcoming efforts include the remediation of constituents present in a World War I-era burning ground, evaluating emerging contaminants (e.g., PFAS and 1,4-dioxane) in Development Area groundwater and soil, and other interim remedies necessary to prepare the area for capping.

Hercules is supporting Hartz as they develop a Fill Use Plan to supplement the RAWP and provide the basis and rationale for on-site movement of clean and alternative fill in accordance with the Technical Requirements for Site Remediation (TRSR) (New Jersey Administrative Code [N.J.A.C.] 7:26E) and Fill Guidance to achieve remedial capping and development design elevations. The integrated approach to capping and development outlined by the Fill Use Plan will optimize the beneficial use of on-site alternative fill materials in concert with appropriate engineering and institutional controls that are protective of public health, safety, and the environment addressing approximately 600 AOCs.

Hartz filed its general development plan and site plan application with the Township of Roxbury Planning Board in August 2022. The application has been deemed administratively complete and is undergoing technical review by the Planning Board. Concurrently, Hartz has applied for and/or obtained associated local (e.g., Mount Arlington Borough), county (e.g., Morris County, Morris County Soil Conservation District) and state (e.g., NJDEP – Land Use, NJDEP – Dam Safety) permits and approvals necessary for development. Based on the anticipated schedule for receipt of permits and approvals, development activities associated with the remedial cap construction would begin at some point in 2025. In the intervening timeframe, Hercules has and will continue to conduct pre-capping interim remedial actions to prepare the area for capping and support Hartz in the planning of development activities in manner that satisfies the TRSR and applicable guidance documents. Specific remedies required in the Remediation Area will follow remedial capping in the Development Area and are outlined in the schedule (Exhibit B).

PCB Soil Excavation & Disposal

The Phase II RIR (May 2016) identified PCBs in two areas of the Facility (Maintenance Area and M5-3 Area) that required further investigation and remediation in accordance with NJDEP's TRSR and United States Environmental Protection Agency's (USEPA's) Toxic Substances Control Act (TSCA). Between 2018 and 2021, Hercules collected nearly 1,000 soil samples as part of a pre-design investigation (PDI) focused on refining delineation of PCBs in soil and defining excavation extents. A USEPA-approved Self Implementing Procedure Plan (SIPP, Hercules 2021a) and

interim remedial action work plans (IRAWP); the Maintenance Area PCB IRAWP (Hercules 2021b) and M5-3 Area PCB IRAWP (Hercules 2021c), addressed Total PCB concentrations requiring remedial excavation and offsite disposal. Hercules established a site-specific migration to groundwater standard for Total PCBs and cleanup objectives in each area representative of anticipated future uses. Specifically, NJDEP Non-Residential Soil Remediation Standards (NRSRS) and USEPA TSCA high occupancy use criteria in the Maintenance Area and NJDEP NRSRS and USEPA TSCA low occupancy use criteria in the M5-3 Area. Excavation, verification sampling, restoration, and supporting tasks were completed from April through October 2022. The project resulted in excavation and offsite disposal of nearly 10,000 cy of PCB-contaminated soil (9,570 cy). Over 3,000 verification samples were collected to verify that the excavation of soil achieved cleanup objectives. Hercules summarized remedial activities in a PCB Soil Interim RAR that will be submitted to NJDEP with the next milestone deliverable. The interim remedial excavation activities in these areas represent PCB-specific components of comprehensive remedies addressing an array of constituents present in the Maintenance Area (part of the Development Area Capping discussed previously) and the M5-3 Area (part of the Old Burning Ground capping remedy - see schedule [Exhibit B]). Remedial action reports for these comprehensive remedies will document capping of residual PCBs in soil consistent with the interim remedial documents. Hercules has spent an estimated $6 million on the remediation of PCBs at the Facility to date.

Concrete Characterization

Concrete demolition debris stockpiles resulting from site decommissioning occur across the site. In 2018 Hercules surveyed the site, identifying more than 260 individual concrete piles totaling approximately 53,000 cubic yards. Concrete stockpile characterization activities followed in 2020/21, yielding over 1,000 samples. Characterization results and proposed future onsite reuse scenarios were presented in a March 2022 Sitewide Concrete Characterization Memo (Hercules 2022b). The memo included an evaluation of the concrete piles for potential reuse during redevelopment and was appended to the Development Area Capping RAWP (Hercules 2022a). Certain stockpiles categorized for unrestricted on-site reuse were crushed in November 2021 and used as road base as part of the TNT Area remedial action in accordance with NJDEP Fill Guidance. Concrete piles requiring disposal within the PCB Remediation area were disposed of offsite as a part of the PCB Excavation event. Hercules continues to manage concrete stockpiles in accordance with both NJDEP – Site Remediation and Solid Waste regulations, with a preference to reuse the material onsite. Concrete reuse is incorporated into the fill use plan that will govern soil movement and use of alternative fill during proposed redevelopment activities. Hercules spent an estimated $1 million on the characterization and management of concrete stockpiles at the Facility to date, the timing of final concrete disposition is dependent upon which remedial project(s) the materials are able to be reused in. Concrete unable to be reused onsite as part of forthcoming remedial actions will be disposed of in accordance with applicable regulations.

Groundwater Monitoring

Hercules continued to evaluate groundwater quality at the Facility following submission of the Phase II RIR (May 2016), conducting periodic sampling of a representative network of groundwater monitoring wells. Eight groundwater sampling events of the representative well network were conducted between 2016 and 2023. As NJDEP subsequently established monitoring protocols and comparison criteria for various emerging contaminants (e.g., PFAS, 1,4-dioxane [1,4-D], 1,2,3-trichloropropane [1,2,3-TCP]), Hercules assessed potential onsite sources and, where appropriate, is conducting groundwater investigations to evaluate the potential presence of these constituents. Specifically:

- No known or potential use of 1,2,3-TCP was identified during a review of operational records and interviews with manager familiar with Facility operations.
- While there are no documented uses of PFAS or 1,4-D onsite, their presence in commercially available products potentially used onsite could not be ruled out. Sampling is currently being conducted for PFAS compounds and 1,4-dioxane.

Given the nature of manufacturing activities at the Facility and potential historical uses of perchlorate, perchlorate was included in the groundwater monitoring analyte list during the SI/RI.

The Receptor Evaluation (RE) submitted as part of the RIR resulted in potable well sampling at a number of downgradient properties that were not entirely reliant on the public water supply. Potable well sampling activities to assess downgradient groundwater quality and potential receptors occurred between 2017 and 2019.

In anticipation of site preparation for the TNT soil bioremediation remedy that required the abandonment of certain wells that were used to monitor the TNT groundwater plume, Hercules conducted a focused round of groundwater sampling in that area for TNT and degradates prior to well abandonment (2021).

Consistent with observations during the SI/RI, groundwater conditions are the site remain stable and consistent over time. Hercules submitted a draft CEA with the Phase II RIR, and updated that CEA in a January 2023 submission to NJDEP. A groundwater RAR/RAP for Facility (excluding TNT Area addressed separately) will be prepared upon completion of emerging contaminant evaluations, Development Area capping, and completion of other soil remedies with an influence on groundwater quality.

Forthcoming Large Remediation Projects

Hercules' remedial strategy has involved the prioritization of complex remedies that require lengthy timeframes for study, design, engineering, permitting, and implementation; or those remedies that facilitate integrated remedial capping and development at the Facility addressing many AOCs at once. Beyond those completed and in-progress projects summarized above, Hercules has identified the following forthcoming remediation projects necessary to close large and/or complex AOCs beyond the Development Area where activities will be focused through 2024.

- Former Burning Ground (H13-7/H12-237)
  The Former Burning Ground supported the thermal destruction of off-specification and/or residual material on the ground surface in the early part of the 20th century. These historical practices resulted in residual chemical concentrations as well as physical debris in the surface soils. A portion of this area will be addressed via pre-capping excavation and disposal and Development Area capping. Hercules has completed an initial phase of pre-design investigation and is working to complete remedial work associated with development in 2024 and 2025, with the remaining work occurring by 2026.

- Old Burning Ground (M5-3)
  The Old Burning Ground historically supported thermal destruction of off-specification and residual energetic material. Old Burning Ground is an open Resource Conservation and Recovery Act (RCRA)-permitted operable unit (OU) subject to a corrective action (i.e., remedy). Hercules is managing the corrective action and closure of this OU through the NJDEP's RCRA Program Coordinator. The remedy selected to fulfill NJDEP requirements will also fulfill Hercules' obligation related to RCRA OU closure. Previous investigation into the Old Burning Ground has identified volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), PCBs, metals, and explosives and energetics (E&E) as constituent classes that potentially will require remediation in this area. Hercules is preparing to conduct pre-design investigatory activities to guide remedial design. The remedy for soil is likely to include a combination of soil consolidation, stabilization, and capping. Remedial activities in this area are anticipated to occur between 2025 and 2028.

- Experimental Dynamite (K5-1)
  Hercules operated an experimental dynamite batch production line that included both formulation and detonation testing. These processes resulted in metals and E&E in soil at the location of former facilities and features. Environmental investigations also identified similar constituents in the sediment of an isolated pond adjacent to the area. Additional investigation and remediation of soil in this area is anticipated to occur between 2026 and 2029, with components of the work potentially coordinated with the closure of the Old Burning Ground.

- WWII Disposal Area (M8-1)
  The WWII Disposal Area was a historical disposal area for empty drums and drum carcasses, discarded smokeless powder storage containers, and other miscellaneous solid debris. Previous investigations identified a concentration of metal debris along either side of a former rail bed bisecting the WWII Disposal Area, with the amount of debris decreasing moving radially away from the former rail bed. Additional investigation and remediation of the debris material in this area and adjacent wetland areas is anticipated to occur between 2026 and 2030.

- WWI Disposal Area (N8-1)
  The WWI Disposal Area was a historical disposal area for remnant equipment resulting from operational area retrofits and realignment in support of and following the war effort. Hercules has completed environmental investigations and a geophysical survey and

environmental investigations to characterize the debris and soil conditions in the area. Remedial activities in this area are anticipated to occur between 2027 and 2030.

- Ballistics Range (H5-8126)
  The Ballistics Range was composed of structures associated with testing propellant (i.e., smokeless powder) formulations to achieve manufacturer-specified projectile velocities. These activities resulted in the lead enrichment of Ballistics Range soil via the introduction of lead shot and bullets to surface soil in discrete areas (e.g., backstop). Environmental investigations identified lead in soil at concentrations requiring active remediation in this area. Additional investigation and remediation of soil in this area is anticipated between 2027 and 2029.

- Former Acid Recovery Area (B11-1)
  The Former Acid Recovery Area was composed of structures associated with the production of nitroglycerin (NG), and later pentaerythritol tetranitrate (PETN). Both NG and PETN production processes relied heavily on concentrated nitric acid solutions. Given the sensitivity of NG to static electrical charges, building floors, process equipment and conveyances were typically lined with lead. Environmental investigations identified lead in soil at concentrations requiring active remediation in this area, as well as lead sheeting and lead debris on the ground surface of this area. Additional investigation and remediation of soil in this area is anticipated between 2026 and 2028.

- NG Area Stormwater Catchment Area
  The NG Area Stormwater Catchment Area is a remnant stormwater management feature at the base of the hillside on which the NG and PETN production lines sat (including the Former Acid Recovery Area). Particulates present in stormwater runoff from these manufacturing areas accumulated and settled in the Stormwater Catchment Area. Site demolition altered the drainage and conveyances, and this feature no longer functions as a stormwater catchment. Environmental investigations identified lead in soil at concentrations requiring active remediation in this feature. Additional investigation and remediation of this feature is anticipated between 2027 and 2029, and will potentially be coordinated with Former Acid Recovery remediation.

In addition to the defined AOCs/Areas noted above, a number of former rail beds exist across the Facility. These rail beds were constructed of historic fill materials during Facility expansion and contain metals and PAHs. In many places these rail beds span wetlands and waters onsite. Focused remediation may be required based on the results of the ERA and/or SRS attainment evaluations. The magnitude and extent of rail bed remediation remains uncertain at this time; the schedule (Exhibit B) acknowledges the likelihood that a subset of the existing rail beds will require active remediation in the 2027 to 2029 timeframe.

Estimated Remedial Timeframe

The schedule (Exhibit B) outlines the estimate remedial timeframe to attain RARs/RAOs with sitewide coverage for environmental media of concern. This schedule represents Hercules' best effort to forecast a path to site closure, and relies, in part, on external factors beyond Hercules'

control. These external factors (e.g., development approvals, regulatory permit review/approval, stakeholder engagement, updates/changes to current regulations and guidance) have the potential to influence scope and/or schedule, the direction and magnitude of these influences cannot be estimated at this time.

Good morning -

An Ecological Component Review of the Phase II Remedial Investigation Report (RIR; May 2016) prepared by Hercules, Inc. for the above-referenced site (also known as the form Kenvil Works Facility) is currently underway. This includes a review of the Ecological Evaluation/Ecological Risk Assessment (EE/ERA, dated April 2016) included as Volume F of the RIR.

The following major issues/concerns with the EE/ERA have been identified that preclude completion of its review, as well as the Ecological Component Review of the Phase II RIR of which it is a part.

General Comment A: the EE/ERA (RIR Volume F) takes a facility-wide approach in its evaluation of potential COPEC impacts to terrestrial (Section 3.3.3.1, page 31 and Figure 3-2, e-page 215) and aquatic (Section 3.3.3.2, page 32 and Figure 3-3, e-page 216) receptors. This approach does not consider (a) the size of specific habitat patches on the site relative to the home ranges of the

receptor species using those patches, (b) specific Environmentally Sensitive Natural Resources (ESNRs) with elevated COPEC (greater than the 95UCL) concentrations, and (c) other specific areas with elevated COPEC concentrations (greater than the 95UCL) that could potentially impact ESNRs. To evaluate the appropriateness of this approach, please note the following comments –

1. The EE/ERA (RIR Volume F) and the RIR Summary (Volume A) do not identify and discuss potential impacts to specific Environmentally Sensitive Natural Resources (ESNRs) on and adjacent to the site as required by NJAC 7:26E-1.16(a), and as specified in Section 5.2.1 of the NJDEP Site Remediation and Waste Management Program Ecological Evaluation Technical Guidance (EETG; Version 2.0, August 2018). RIR Summary (Volume A) Figure A-6 (e-page 101) and RIR Volume F (EE/ERA) Figure 2-2 (e-page 213) provide mapping of selected types of habitat present on the site (including forest, wetlands, and aquatic areas – but not vernal pools). However, RIR Summary (Volume A) Section 2.3.2 (page 2-4) provides a very cursory overview (or none at all) of these habitats; RIR Volume F (EE/ERA) Section 2.6 (and sub-sections; pages 10-15) describes various types of terrestrial, aquatic, and wetlands habitats on the site but does not identify specific ESNRs. RIR Volume F (EE/ERA) Section 2.5 (page 9) discusses the presence of State and federal Threatened and Endangered (T/E) species on the site and states that "[n]one of the T & E species listed as possibly present on or near the Facility have been identified onsite[sic]". However, potential habitat for bog turtle (*Glyptemys muhlenbergii)* has been identified on-site, and species-specific surveys for other T/E species that may be present on the site have apparently not been conducted.

2. RIR Volume F (EE/ERA) Section 3.3.3.1 (page 31) states the "formerly developed portion of the Facility (the Remedial Area) provides patches of habitat for ecological receptors. Upper-trophic-level [sic] ecological receptors using onsite [sic] terrestrial habitats are likely to move among the habitat patches that share a common list of Facility-related constituents, as well as similarities in habitat type and composition". However, it could be expected that the distribution of lower trophic level receptors/prey would be limited to smaller habitat patches with a variety and range of COPEC concentrations (potentially including concentrations greater than the 95UCL).

3. RIR Summary (Volume A) Section 4.2.2 (page 4-8) notes that "natural succession of flora and fauna growth has been allowed to progress uninhibited with vegetative communities expanding" since the completion of facility demolition activities in 2003. RIR Summary (Volume A) Section 5.3.3 (page 5-17) further states that the "combination of increased habitat and decreased activity and disturbance likely increased the number and variety of ecological receptors using the Facility". It appears that field surveys of the site were last conducted in July 2010 and May-July 2011 (RIR Volume F [EE/ERA] Section 2.6, page 10); given the age of these surveys and continuing post-demolition secondary succession occurring on-site, it may be appropriate to conduct additional surveys to develop an updated habitat characterization.

General Comment B: RIR Volume F (EE/ERA) Section 3.3.4.1 (page 33) and Figure 3-2 (e-page 215)

identify terrestrial "Areas of Presumed Remedial Action" (including areas where ecological risk is likely/very likely; Executive Summary, page ES-2) that have been excluded from the EE/ERA terrestrial ecological risk evaluations. However, these areas have not been otherwise so identified for remediation in the Phase II RIR. See Comments #4-#8 below – based on these conclusions and recommendations of the Phase II RIR, it appears to be premature/inappropriate for the EE/ERA to identify terrestrial "Areas of Presumed Remedial Action". Further, such a designation appears to potentially pre-judge future decisions regarding the need to conduct remedial activities on the site.

4. RIR Volume F (EE/ERA) Section 3.3.4.1 (page 33) prioritizes the "Areas of Presumed Remedial Action" using a tiered system "to guide the feasibility study process". This tiered system is "based (in part) on elements such as complexity of the remedy, severity of the effects, duration of remedy implementation, and/or alignment with Facility redevelopment planning". This tiered priority system, and the associated data and evaluations used to implement it, were not included in the Phase II RIR. Table 3-1 (e-page 138) of RIR Volume F (EE/ERA) summarizes the "History", "Fate and Transport", and "Remedial Objective" (including presumptive remedies, additional investigations, and the need to conduct additional evaluations during the feasibility study process) for each of the areas. RIR Volume F (EE/ERA) Section 3.2.2 (page 23) notes that "[p]re-design investigations are underway in these areas to support remedy selection and design"; also see the descriptions of these areas in RIR Volume F (EE/ERA) Appendix B, e-page 1984.

5. The Phase II RIR concludes (RIR Summary [Volume A] Section 6, page 6-1) that "refining the extent of certain constituents on an area- or constituent-specific basis is necessary to develop appropriate remedies protective of human health and the environment". Further, additional investigations are recommended that "would inform the preparation of a soil management plan and remedial action selection report (feasibility study), and ultimately remedial action design and implementation. Hercules believes a document focused on remedial action selection … represents a meaningful step in the remedy process given the scale and complexity of the Facility".

6. RIR Volume B (Soil) Section 6.4 (page 47) also states "refining the extent of certain constituents on an area- or constituent-specific basis is necessary to develop appropriate remedies protective of human health and the environment". Further, "additional data should be collected as part of pre-design investigation[s] supporting the feasibility study/remedial design process, as they may reduce the footprint and/or quantity of soil subject to remediation and reduce disturbance to ecologically sensitive areas".

7. RIR Volume D (Sediment) Section 6.4 (page 44) states the EE/ERA "acknowledges that remedial action is necessary in certain areas of the Facility, prioritizes these areas based on complexity and severity, and outlines presumptive remedies with each area … Hercules is committed to addressing these areas, and other areas identified via ongoing risk assessment activities. Comprehensive remedies addressing both upland source areas and related sediment influences will be developed to address protection of both human health and [the] environment".

8. RIR Volume E (Surface Water) Section 6.4 (page 30) states that Hercules will (a) "[c]ollectively evaluate remedial actions related to soil and sediment to identify their influence on surface water quality and incorporate surface water quality remedial goals into the design process", and (b) "[e]valuate Facility-related influences on surface water quality that do not coincide with soil and/or sediment remedies as part of the remedial design process". Further, the "results of the EE/ERA (Volume F) will also influence remedial decision making with respect to ecological endpoints".

9. RIR Volume F (EE/ERA) Section 3.3.3.2, page 32 and Figure 3-3, e-page 216: The Southern Drainage Aquatic Exposure Area includes areas/ditches along Route 46 and the southeastern boundary of the site that are outside the established Remedial Area Boundary, but "receive surface water and suspended sediment from the southern wetland complex (within the Remedial Area boundary) that drains operational areas of the Facility. These drainage channels also receive runoff from Howard Boulevard and Route 46". Are terrestrial/upland parcels in this area also impacted by these discharges?

10. A review and comparison of RIR Volume F (EE/ERA) Figure 3-2 (e-page 215) and RIR Summary (Volume A) Figure A-6 (e-page 101) indicates that the boundaries of the terrestrial "Areas of Presumed Remedial Action" include streams/ditches (particularly in the TNT Area; areas denoted "1" on EE/ERA Figure 3-2), and thus potentially riparian areas and wetlands associated with these waterbodies. Have the extent of wetlands and riparian areas on the site been verified by a NJDEP Land Use Regulation Program Letter of Interpretation? RIR Volume F (EE/ERA) Section 2.6 (page 10) notes that a Facility-wide wetlands assessment was conducted in May-July 2011.

Please provide the following information concerning these "Areas of Presumed Remedial Action": (a) the basis for concluding (and prioritizing – see Comment #1 above) that remedial action is needed in these areas, (b) the status/schedule of remedial actions in these areas, (c) the type of remedial actions (to be) completed in these areas, and (d) an evaluation of the potential effects of these remedial actions to eliminate/reduce potential COPEC-related impacts to terrestrial and aquatic receptors (it appears that these areas are within/adjacent to wetlands and/or surface waterbodies).

General Comment C: RIR Volume F (EE/ERA) Section 3.3.4.2 (page 34) discusses "Areas Beyond the Remedial Area Boundary", and notes that these areas were identified in the Site Investigation/Phase I RI by comparing sample results to "criteria protective of human health (i.e., soil remediation goals)". It is also stated that "sample results from the undeveloped areas around the margins of the Facility (outside the Remedial Area) were evaluated in the context of potential ecological risk". This analysis was conducted in RIR Volume F (EE/ERA) Appendix C (e-page 2133) in which the 95UCL of the mean for each COPEC was compared to ecological screening benchmarks. Those COPECs with an HQ $\geq$ 1 that also bioaccumulate were then further evaluated using a food web model to estimate potential impacts to upper trophic level species.

- A review of the soil data used in this analysis (Table C-1, e-page 2140) indicates that for a

number of the COPECs – particularly arsenic, beryllium, chromium, cobalt, copper, lead, manganese, nickel, selenium, zinc, and nitroglycerin – the maximum detected concentration in the soil samples is substantially greater than its 95UCL. Thus, there may be locations in the "Areas Beyond the Remedial Area Boundary" where elevated COPEC concentrations potentially result in adverse ecological impacts.

- RIR Volume F (EE/ERA) Appendix C, Section 3.1, page 2: identifies seven (7) metals with 95UCL concentrations with an HQ $\geq$ 1 for potential impacts to terrestrial plants and soil invertebrates. However, the conclusions of this evaluation (Section 4, page 3) appear to disregard these results when stating that "potential ecological risks beyond the Remedial Area are unlikely".

- RIR Volume F (EE/ERA) Appendix C, Figure C-1 (e-page 2148): a wetlands area in the southern portion of the site along Route 46 is included in the "Areas Beyond the Remedial Area Boundary". However, the evaluation of the soil/sediment data collected in this area did not include comparisons to the NJDEP Freshwater Sediment Ecological Screening Criteria to calculate HQs.

General Comment D: Section 5.3.3.1 of the NJDEP Site Remediation and Waste Management Program Ecological Evaluation Technical Guidance (EETG; Version 2.0, August 2018) specifies that soil (and sediment) samples should be collected from the 0 to 6-inch below ground surface (bgs) depth interval (except for those to be analyzed for VOCs). A cursory review of the collected soil data (RIR Volume B [Soil] Appendix F, e-page 22028), and previous NJDEP November 18, 2010 comments on the Phase I Remedial Investigation (RI; noted below), indicate that very few of the soil samples collected during the Site Investigation (SI), Phase I RI, and Phase II RI work were collected from the 0-6 inch bgs depth interval. The requirement to collect soil (and sediment) samples at this depth interval was previously identified in the following NJDEP November 18, 2010 comments (RIR Volume A-Summary, Attachment 2, e-page 230) –

11. "Volume B – No. 2: Section 2.4 – Soil Sampling" stated "[t]ables indicate that most surface soil samples were collected from [the 6-12 inch interval below ground surface]. This is deficient according to NJAC 7:26E-3.6(a)3 which states that initial characterization of soil samples (except VOC samples) shall be collected at 0-6 inches below grade … ";

12. "Volume B – No.3: Section 2.4.1.3" stated that "no (0-6") [soil samples] were collected from any of the AOCs";

13. "Volume A – No. 14 -Section 8.0 – Future Actions" (Bullet #3) stated that additional "surface soil sampling from the 0-6" interval from various AOCs throughout the site, particularly … [in] areas where surface discharges may have occurred" may be required;

14. In addition, it appears that many/most of the Phase II RI soil samples were not collected at the 0-6 inches below ground surface depth interval (for example, see RIR Volume B (Soil Remedial Investigation), Figure B-3, e-page 163).

Section 3.3.1.1 (page 26 – Footnote 3) of RIR Volume F (EE/ERA) states that the soil samples used in the EE/ERA were collected "with a starting depth of 0 to 1 foot [bgs] and an end depth of no more than 3 feet bgs … and includes intervals spanning the biologically active zone (BAZ)". However, the EE/ERA (RIR Volume F) soil (and sediment) dataset included samples collected from the 0-12 inch bgs interval, including samples that included any portion of the 0-12 inch bgs interval (Volume F [EE/ERA] Section 4.1.1, page 38). Table 4-1 (e-page 141) of RIR Volume F (EE/ERA) provides a summary of the collected soil (and sediment) data. Of the forty-five (45) depth intervals listed, only four (4) solely encompass the 0-6 inch (0.5 feet) bgs depth interval, with an additional nine (9) depth intervals of 0-12 inches (1.0 foot) bgs and seven (7) depth intervals within the 0-12 inch bgs interval. Thus, twenty-five of the soil sample depth intervals listed extend deeper than the 0-12 inch bgs depth of the BAZ.

15. In order to evaluate the suitability of the soil (and sediment) data used in the EE/ERA, Table 4-1 (e-page 141) of RIR Volume F (EE/ERA) should be revised to indicate (a) the total number of soil (and sediment) samples collected in each of the listed depth intervals, and (b) the total number of samples collected in each of the listed depth intervals within each of the 13 soil AOCs.

16. In addition, to further evaluate the suitability of the soil (and sediment) data used in the EE/ERA: within each of the 13 soil AOCs, an analysis should be conducted – where the appropriate data are available – comparing COPEC concentrations in samples collected within the 0-12 inch bgs depth interval (i.e., the twenty (20) intervals noted above) with those collected at deeper depths to verify that COPEC concentrations are not elevated in the 0-12 bgs depth interval samples compared to those in the other (i.e., "deeper") depth interval samples. If that were the case, inclusion of these deeper samples in the calculations of the mean, 95UCL, etc. statistics would result in underestimates of the COPEC concentrations in the biologically active zone (0-12 inches bgs).

17. Samples collected outside the 0-12 in bgs depth interval (i.e., three (3) intervals listed in EE/ERA Table 4-1 of 1-1.5 ft bgs, 1-1.6 ft bgs, and 1.08-1.58 ft bgs) are outside what is generally considered to be the biologically active zone and therefore should not be used in the EE/ERA. In addition, some samples (5 depth intervals) were collected to depths extending beyond 3 feet bgs (up to 10 ft bgs) as stated in Section 3.3.1.1 (page 26 – Footnote 3) of RIR Volume F (EE/ERA).

General Comment E: see General Comment D. RIR Volume F (EE/ERA) Table 4-1 (e-page 141) incudes sediment samples collected at a depth interval of 1-1.5 feet bgs; these samples are outside what is generally considered to be the biologically active zone (0-12 inches bgs) and therefore should not be used in the EE/ERA. In addition -

18. A cursory review of the data presented in RIR Volume D (Sediment) Appendix G (e-page 9667) indicates that all of the previous SI and Phase I RI sediment samples were collected

at depth intervals of 0.5-1 ft bgs, 1-1.5 ft bgs, and 1.5-2 ft bgs. RIR Volume F (EE/ERA) Table 4-1 (e-page 141) includes sediment samples collected at a depth interval of 0.0-0.5 ft bgs; are these limited to the Phase II RIR sediment samples?

General Comment F: RIR Volume F (EE/ERA), Section 7, page 66: for HQ calculation and ecological risk characterization purposes, concludes that the HQ-LOAEL "provides a more representative indicator of potential ecological risk to upper-trophic-level [sic] receptors than the HQ-NOAEL"; also see Section 7.4, page 75. Section 6.1.33 of the NJDEP EETG states that both "NOAEL-based and LOAEL-based HQs should be developed to bound the risk estimates". Tables 7-3 to 7-9 (e-pages 181-186), Tables 7-13 to 7-18 (e-pages 191-196), and Tables 7-22 to 7-28 (e-pages 201-207) include HQs calculated using both NOAELs and LOAELs. Section 7.1.3 (and subsections; pages 68-69) should also present and discuss the NOAEL-based HQs.

Please provide a response to these comments by July 26, 2019 so that the Ecological Component Review of the Phase II RIR can be completed. If you would like to discuss these comments via a teleconference, please contact me as indicated below.

Upper Trophic Level Receptor Dose Model Setup

Estimated Prey Item Tissue Concentrations
- Soil BAFs estimate COPEC concentrations in biological tissue
- Sourced from literature
- BSAFs use as surrogate in absence of BAF

Food Web Model
- Estimates the dose of a COPEC through dietary ingestion of soil/sediment and prey item tissue

$$DDD = \frac{\{[(IR_f \times C_f) + (IR_s \times C_s)] \times SUF\}}{BW}$$

- DDD = Daily dietary dose of COPEC (mg/kg per day)
- Cf = Concentration of a COPEC in food (mg/kg)
- IRf = Daily ingestion of food (kg/day)
- Cs = Concentration of a COPEC in soil/sediment(mg/kg)
- IRs = Daily incidental ingestion rate of soil/sediment (kg/day)
- SUF = Site use factor (unitless)
- BW = Body weight (kg)

Most conservative input parameters used for site use factor, dietary composition, and bioavailability

Site-specific ESC for Lead (488 mg/kg)
- Back-calculated from American robin food web model ($HQ_{LOAEL} = 1$)
- Most conservative of upper trophic level terrestrial receptors

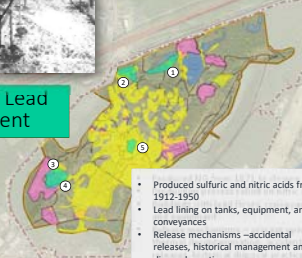
Food Web Model

$$DDD = \frac{\{[(IR_f \times C_f) + (IR_s \times C_s)] \times SUF\}}{BW}$$

- DDD = Daily dietary dose of COPEC (mg/kg per day)
- Cf = Concentration of a COPEC in food (mg/kg)
- IRf = Daily ingestion of food (kg/day)
- Cs = Concentration of a COPEC in soil/sediment(mg/kg)
- IRs = Daily incidental ingestion rate of soil/sediment (kg/day)
- SUF = Site use factor (unitless)
- BW = Body weight (kg)

Terrestrial Lead Investigation

Areas of Lead Enrichment

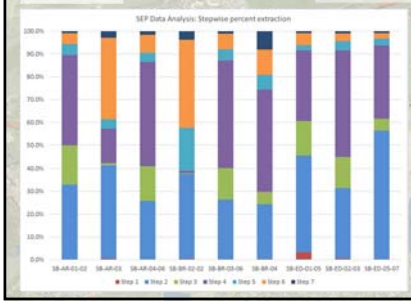


- Produced sulfuric and nitric acids from 1912-1950
- Lead lining on tanks, equipment, and conveyances
- Release mechanisms –accidental releases, historical management and disposal practices

1. Development Area – Experimental Dynamite Production Area
2. Development Area – Ballistics Range
3. Pentaerythritol tetranitrate (PETN)/Nitroglycerin (NG) Area – Acid Recovery
4. NG Area – Former Ponds
5. Maintenance Area – Acid Production Plant

Terrestrial Lead Investigation

SEP Analysis



- Step 1 – exchangeable fraction
- Step 2 – carbonate fraction
- Pb species in these soil fractions
  - are weakly bound
  - can easily enter the food chain
  - can be easily remobilized by changes in environmental conditions

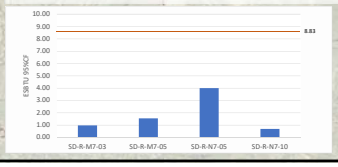
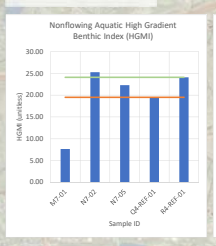
PAHs - Equilibrium Partitioning Approach
- 34 PAH dataset unavailable
- Conservative approach using 13-PAH dataset and correction factor (CF)
- Equilibrium Partitioning Benchmark Toxic Units (ESBTU) - Comparison to Central Drainage Basin 34-PAH dataset
  - 34-PAH ESBTU = 1.0; same dataset using 13-PAH ESBTU = 8.83

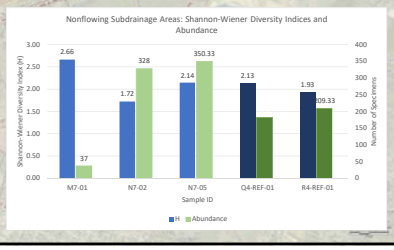


Additional 34-PAH dataset samples collected in 2019 – average 13-PAH ESBTU was 7.48

Refined Risk Assessment
Aquatic Receptors – Unnamed Ponds

Benthic Community

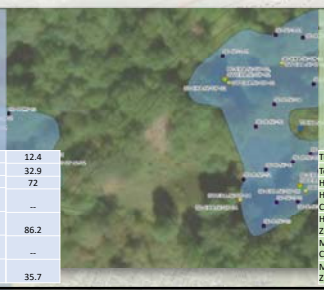




Refined Risk Assessment
Aquatic Receptors – Unnamed Ponds

Smaller Pond
- Water depths < 3 inches may have influenced sample results
- Additional investigation of zinc when standing water was present - no exceedances

Turbidity (NTU)	71,000	12.4
Total Suspended Solids (mg/l)	1,880	32.9
Hardness (mg/l CaCO3)	120	72
Hardness-dependent SWQS - Copper (ug/l)	9.9	--
Hardness-dependent SWQS - Zinc (ug/l)	133	86.2
Maximum Detected Dissolved Copper (ug/l)	4.4	--
Maximum Detected Dissolved Zinc (ug/l)	**247**	35.7



Larger Pond
- Potential risks to aquatic life attributable to copper and zinc are acceptable
- No further evaluation is necessary

Turbidity (NTU)	12.5
Total Suspended Solids (mg/l)	44
Hardness (mg/l CaCO3)	22.1
Hardness-dependent SWQS - Copper (ug/l)	2.33
Hardness-dependent SWQS - Zinc (ug/l)	31.7
Maximum Detected Dissolved Copper (ug/l)	ND
Maximum Detected Dissolved Zinc (ug/l)	8.7

Compared to surface water quality standards (SWQS) protective of aquatic life
*hardness dependent value

Surface Water Dataset

- The ERAWP identified COPECs in the MDE, MDW, and TPND subareas based on **total metals** data from the SI/RI
- Dissolved metals results (collected in 2016), estimate the potential for ecological risk to aquatic receptors
- No additional evaluation of surface water in the SDA is recommended

Refined Risk Assessment
Aquatic Receptors – Northern Drainage Area

Evaluation Approach

COPEC	Approach	
2,4-Dinitrotoluene	Dataset Evaluation	Evaluation of dataset size, concentrations, and locations; proximity to historic fill or offsite influences
Arsenic	Background Threshold (Sander 2003)	
Cadmium	Acid Volatile Sulfide/Simultaneously Extracted Metals (AVS/SEM)	Toxicity unlikely if ∑SEM-AVS /fOC <130 umol/gOC
Copper	AVS/SEM	
Lead	AVS/SEM	
Manganese	Dataset Evaluation	
Mercury	Study Comparison (Conder et al 2015)	No observed effect concentrations (NOEC) in Hg-spiked sediment and field-collected sediment from Hg sites
Silver	AVS/SEM (monovalent); dataset evaluation (divalent)	
Zinc	AVS/SEM	
PAHs (14)	Equilibrium Partitioning	Conservative approach using 13-PAH dataset and correction factor
Benthic Community		Comparison to reference locations; High Gradient Benthic Index and Shannon-Wiener Diversity Indices and Abundance

Hercules Email Correspondence dated 3 June 2024

From:	Caryn Barnes
To:	Pecchioli, Joel [DEP]
Cc:	Pinkstone, Raymond [DEP]; Edward Meeks; Scott Larew; Ian Mccary; Andrea Berlinghof
Subject:	FW: Hercules Kenvil/Alliant TechSystems - PI No. 000741
Date:	Monday, June 3, 2024 9:22:41 AM

Hi, Joel,
The following provides an update of activity since our meeting and recommendations to move the ERA forward.

During the Dec 2019 meeting, Hercules and NJDEP discussed the pending development activities at the site, their influence on the ERA, and the value of defining the footprint of development prior to additional risk-related work. Subsequent to our meeting, Hercules entered into an agreement with a buyer who has put forth a plan to develop an approximately 210-acre portion of the facility (www.roxburycommercecenter.com) where the development functions as a remedial cap (and rendering ecological exposure pathways incomplete in that area). The development will remediate more than 50% of the AOCs onsite.

Hercules has completed large soil removal efforts (e.g., PCBs in soil) to prepare the area for capping and is working with the developer and NJDEP to optimize the use of onsite sources of fill (clean and alternative) in the remedial capping. Hercules was working on an update to the Ecological Risk Assessment using the developer's proposed footprint of development. As the developer engaged with various authorities (incl. NJDEP) to permit the proposed development, the design (including extents/footprint) was modified in response to agency feedback. As each of these changes influenced the ERA dataset, Hercules deferred completing the update until the developer had final submissions/approvals in place that define the limits of the remedial cap and development. A majority of development approvals are currently in place.

In the interest of making progress on the ERA in parallel with development, Hercules will prepare A) a status update memorandum discussing the tiered areas of presumed remedial action, and B) a data summary report presenting the results of ERA activities conducted since the Phase II RIR (2016). These documents will be submitted with a cover letter addressing how NJDEP's 2019 comments are/will be incorporated into the ERA. The data summary report will not include a full ERA risk characterization update at this time, that update would follow upon receipt of the pending development approvals and definition of the approved footprint of development (and associated ERA dataset). Following NJDEP review of these documents, we believe it would be valuable to meet onsite to discuss the steps to complete the ERA in areas that will remain undeveloped and review the status of the areas of presumed remedial action.

Thank you.

Good morning -

I am writing to request a status update on the above-referenced site.

Initial Ecological Component Review comments/questions on the Phase II Remedial Investigation Report (May 2016) prepared by Hercules, Inc. were transmitted to the previous LSRP (Mark Foley) in a July 8, 2019 e-mail from myself.

These comments - and proposed additional work to be completed - were discussed at a December 5, 2019 meeting.

However, the COVID pandemic struck a few months later, and it is not known if the additional work has been completed and if any efforts have been undertaken to address the initial Ecological Component Review Comments.

Please contact me if you have any questions.

Thank you -

Subject: [EXTERNAL] RAW Withdrawal -LSR 120001 - Alliant

Hi, Diane,

We are respectfully requesting to withdraw the following report:

DEVELOPMENT AREA – SOIL REMEDIAL ACTION WORK PLAN, dated August 2022, prepared by Ramboll US Consulting, Inc.

- The online submission name for this report was RAW-AOC#1407236 @ 000741 – ALLIANT TECHSYSTEMS INC
- Activity Number Reference: LSR120001
- Created on: 8/12/2022

This remedial action work plan specifically addresses a proposed development plan and development area for a property transaction that is no longer viable. Ongoing remediation activities at the site will continue as planned, in accordance with separate remedial action work plan submittals. The document that we are requesting to withdraw does not have an associated NJDEP timeframe, so we do not believe the withdraw should cause administrative issues for the site remedial timeframe.

Please let us know if additional information should be provided to DEP to withdraw this report.

Thanks for your help.
Caryn

Good morning -

Initial Ecological Component Review comments on the Phase II Remedial Investigation Report (RIR; May 2016) prepared for the above-referenced site were transmitted in a July 8, 2019 e-mail from Joel Pecchioli to Mark Foley (WSP). This included a review of the April 2016 Ecological Evaluation/Ecological Risk Assessment (EE/ERA). The July 2019 e-mail presented "major issues/concerns with the EE/ERA … that preclude completion of

its review, as well as the Ecological Component Review of the Phase II RIR".

Subsequently, a Technical Consultation was held on December 5, 2019 to discuss these comments.

Since that time, it appears the following two (2) documents have been submitted to the Department - these documents have not been reviewed by ETRA:

(1) Remedial Action Workplan - M5-3 Area PCB Soil IRM (dated August 2021), prepared by Kennedy Jenks.

(2) PCB Pre-design Investigation Report and Maintenance Area Soil Interim Remedial Action Workplan (dated August 2021), prepared by Kennedy Jenks.

A June 3, 2024 e-mail from Caryn Barnes (Langan) to Joel Pecchioli provided an updated status of the site, including notice of pending redevelopment activities on a 210-acre portion of the site. In addition, it was reported that "Hercules was working on an update to the Ecological Risk Assessment using the developer's proposed footprint of development".

A September 10, 2024 e-mail from Caryn Barnes to Joel Pecchioli reported that "[t]he proposed redevelopment project .... has fallen through".

Consistent with the Department's "7/60 Day" policy, please provide an updated EE/ERA report by September 2, 2025. This report must resolve all the outstanding comments and issues in the above-refenced July 8, 2019 review e-mail, and provide all the data and information needed for the Department to complete its Ecological Component Review of the May 2016 RIR. If it does not, the May 2016 RIR will be returned to the Bureau of Inspection and Review (BIR) for further instruction.

Please confirm receipt of this e-mail by July 8, 2025.

Please contact me if you have any questions.

Section 1: Introduction

On behalf of Hercules LLC (Hercules), Kennedy/Jenks Consultants (K/J) prepared this Ecological Risk Assessment: Terrestrial Lead Work Plan (TLWP) for the former Hercules Kenvil Works Facility, located on Hercules Road in Kenvil, Morris County, New Jersey (the Facility) (**Figures 1 and 2**). This document summarizes the characterization of potential ecological risk in terrestrial habitat at the Facility and outlines a sampling plan to provide additional lines of evidence related to terrestrial assessment endpoints.

This TLWP was prepared in accordance with New Jersey Administrative Code (N.J.A.C.) 7:26E - New Jersey Department of Environmental Protection's (NJDEP's) Technical Requirements for Site Remediation (TRSR), NJDEP's Ecological Evaluation Technical Guidance (EETG, NJDEP 2015), and NJDEP's Field Sampling Procedures Manual (NJDEP 2005). As recommended in the EETG (NJDEP 2015), ecological investigation and assessment activities are consistent with United States Environmental Protection Agency's (USEPA's) Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments (USEPA 1997) and other federal guidance on conducting ecological risk assessments.

1.1 Background

The Phase II Remedial Investigation Report (RIR) (Hercules 2016) included an Ecological Evaluation/Ecological Risk Assessment (EE/ERA) that evaluated potential ecological risks using site investigation (SI)/remedial investigation (RI) results. Data generated during the SI focused RI activities within and immediately adjacent to the former manufacturing areas onsite (the Remedial Area). The EE/ERA reviewed SI/RI data to identify areas where historical operations (e.g., emplacement of historic fill, point source releases, process upsets) influenced environmental media within the Remedial Area. Based on this information, the EE/ERA separated the Facility into three general categories to focus the risk assessment:

- Areas where ecological risk is negligible (undeveloped areas beyond the Remedial Area).
- Areas where constituent concentrations and/or physical characteristics merit remediation (e.g., ecological risk likely), regardless of the outcome of the ecological risk assessment process (Areas of Presumed Remedial Action).
- Areas where ecological risk is uncertain.

This reductive approach focused the quantitative evaluation of ecological risk presented in the EE/ERA on places where potential ecological risk was uncertain within the Remedial Area, without confounding the process by evaluating locations where potential ecological risk is unlikely or very likely. Areas where potential ecological risk is unlikely or very likely were evaluated separately. Using this approach, the EE/ERA identified areas of the Facility that present unacceptable ecological risk and provided a foundation on which to base additional focused ecological evaluation.

Results of the exposure assessment, effects characterization, risk characterization, and uncertainty analysis conducted as a part of the EE/ERA indicated that adverse effects by exposure to COPECs at the Facility are unlikely for terrestrial invertebrate communities, as well as herbivorous and carnivorous avian and mammalian populations. EE/ERA results indicated that adverse effects to terrestrial plant communities and insectivorous avian and mammalian populations by exposure to metals COPECs at the Facility are possible. Hazard quotients (HQ) based on a comparison to lowest observed adverse effects level (LOAEL) ecological screening benchmarks (ESB) presented in the EE/ERA are summarized below.

Summary of Findings - EE/ERA

Terrestrial Receptor		**HQ_{LOAEL}**
Terrestrial Invertebrates		**HQs>1 (Cu, Mn, V, Zn)**
Plants		**HQs > 1 (10 metals)**
Avian	American robin (*Turdus migratorius*)	**HQs > 1 (PCBs, Pb, Cu)**
	Northern bobwhite (*Colinus virginianus*)	≤ 1
	Red-tailed hawk (*Buteo jamaicensis*)	≤ 1
Mammalian	Short-tailed shrew (*Blarina brevicauda*)	**Pb HQ > 1**
	White-tailed deer (*Odocoileus virginianus*)	≤ 1
	Red fox (*Vulpes vulpes*)	≤ 1

Pb = lead, Cu = Copper, Mn = Manganese, V = Vanadium, Zn = Zinc, PCBs = Polychlorinated biphenyls

Overall, the EE/ERA concluded that potential ecological risk at the Facility is low, with the greatest potential for adverse effects attributable to lead; and recommended additional ecological risk assessment activities to refine risk estimates and identify areas of the Facility driving risk.

An ERA Work Plan, included as an attachment to the EE/ERA, addressed these recommendations. The ERA Work Plan presented a desktop evaluation that refined risk estimates using more realistic exposure parameters and assumptions relative to the EE/ERA's initial conservative assessment.

The desktop evaluation:

- Modified site use factors (SUFs), conservatively set at 1 in the EE/ERA, to reflect species-specific migratory patterns and home ranges from USEPA (1993)
- Updated dietary composition to reflect information available from species-specific field studies presented by USEPA (1993) and Hansen (2011).
- Preferentially selected toxicity reference values (TRVs) based on species-specific studies of wild (rather than domesticated/lab-raised) individuals presented in USEPA documents and/or peer-reviewed scientific literature.

These refined modeling parameters yielded the following HQs.

COPEC	Short-tailed Shrew	American Robin
Copper	-	≤1
Lead	≤1	**3**
Total PCBs	-	≤1

Based on these results, the ERA Work Plan concluded that additional evaluation of the form(s) and speciation of lead is needed to better understand and assess its potential bioavailability to American robin.

1.2 Scope and Objectives

This TLWP builds upon the findings of the EE/ERA and the ERA Work Plan presented in the RIR (Hercules 2016) and outlines data collection activities to refine existing conclusions regarding lead in soil and its potential risk to terrestrial receptors.

The objectives of this TLWP are as follows:

- Identify areas of lead concentrations in soil driving risk estimates (areas of enrichment [AoEs].
- Develop conceptual site models (CSMs) for each AoE.
- Establish a sampling plan to evaluate bioavailability, chemical speciation, and physical form of lead in soil of AoEs and the potential for upper trophic level receptor prey items to bioaccumulate lead.

Ultimately, the information in this TLWP will be coupled with the data and field information generated by the proposed sampling activities to inform a refined risk characterization presented in an ERA addendum.

Section 2: Areas of Enrichment

Historical information regarding uses of lead during operations indicates that lead was most commonly used in elemental form as an anti-static, non-sparking material in various stages/structures in manufacturing processes. Based on operational layout and specific process-related uses, lead was limited to distinct areas where raw, intermediate, and final products remained sensitive to electrical charges and/or concentrated acids were used in the production processes.

Acknowledging that lead was used in defined areas and in association with discrete processes, identification of AoEs relied on Facility knowledge and field reconnaissance along with a focused review of the SI/RI dataset and case inventory document (CID). The data/CID review identified clusters of areas of concern (AOCs) with related processes and lead influences in surface soil. These groups of AOCs were aggregated to form AoEs. This evaluation identified five AoEs where lead concentrations in surface soil disproportionately influence ecological risk assessment results relative to the area over which they occur and merit further investigation:

- Development Area – Experimental Dynamite Production Area (EDPA; AoE-1)
- Development Area – Ballistics Range (AoE-2)
- Pentaerythritol tetranitrate (PETN)/Nitroglycerin (NG) Area – Acid Recovery (AoE-3)
- NG Area – Former Ponds (AoE-4)
- Maintenance Area – Acid Production Plant (AoE-5)

Figure 3 presents Remedial Area SI/RI sample locations and associated lead concentrations in soil between 0 and 2 feet below ground surface (ft bgs). **Sections 2.2.3** through **2.2.5** identify areas of concern associated with each AoE and present conceptual site models specific to each AoE.

As illustrated on **Figure 3**, the five AoEs noted above contain clusters of samples with elevated lead concentrations (i.e., concentrations exceeding a back-calculated, risk-based, site-specific ESC [SSESC] for lead of 488 milligrams per kilogram [mg/kg]). Beyond these areas, remaining elevated lead concentrations exist either a) in Areas of Presumed Remedial Action, or b) as individual isolated samples with minimal influence on risk to upper trophic level receptors across the exposure area. On February 27, 2018 a field reconnaissance site visit documented observations of surface soil conditions and the presence of debris in AoEs.

Figures 4 through **7** present SI/RI sample locations and associated lead concentrations in the 0 and 2 ft bgs soil interval for each AoE.

2.1 Dataset

The dataset for each AoE consists of surface soil samples within the AoE boundary. Consistent with the EE/ERA, surface soil samples are defined as any sample with all or a portion of the

sample interval between 0 and 2 ft bgs. Groundwater data are also available in each AoE from sampling events from 2005 through 2016, utilizing an existing network of monitoring wells (**Table 6)**.

Lead data from soil samples in each AoE were compared to the SSESC for lead (488 mg/kg). This value, derived from the American robin, represents the most conservative ESC back-calculated to an HQ_{LOAEL} of 1 using the ERA Work Plan food web models for terrestrial receptors (Table 4, ERAWP 2016). The equation considers the toxicity reference values, site use factors, and diet of the American robin and is provided in **Appendix E**. Sediment samples in the NG Area - Former Ponds collected during the RI have been reclassified as soil samples based on recent and current conditions (habitat does not support aquatic/benthic communities) resulting from changes in Facility hydrology following cessation of Facility operations. **Tables 1** through **5** present the datasets for lead in soil in each AoE. These datasets are summarized below.

AoE	Detected / Analyzed	Exceeds SSESC*	Minimum	1st Quartile	Median	3rd Quartile	Maximum	Location of Maximum
AoE-1	44 / 44	23	4.82	59.6	474	1,848	98,550	TP-R-K5-2-31.0N
AoE-2	23 / 23	6	6.58	67.3	133	522	144,000	I5-3-060.75N
AoE-3	106 / 106	60	4.34	155	491	1,388	68,200	C11-1-041N
AoE-4	8 / 8	7	36.1	1,032	1,400	1,760	148,000	SD-R-D11-071.0N
AoE-5	25 / 25	21	62.5	866	2,040	4,245	16,800	H10-9104-021N

*SSESC = site specific environmental screening criteria

AoE-specific fate and transport of lead is explored further in the CSMs that follow.

2.2 Conceptual Site Model

Historically, elemental lead was prevalent in structures where explosives were manufactured due to its non-sparking, non-static properties. Lead-lined floors and material conveyances were common, as were lead process equipment and tools. Given its importance onsite, lead was commonly recycled/reclaimed when demolishing buildings and re-formed into sheeting, conveyances, and equipment to support other operations onsite. However, process upsets, as well as thermal decontamination and demolition could have introduced elemental lead into surface soil. Propellant development required testing of ammunition at the Ballistics Range, resulting in the introduction of lead shot and bullets to surface soil in discrete areas.

The manufacturing, use, and recovery of nitric and sulfuric acid may have leached lead from conveyances and equipment. Typically, spent acids were recovered and purified for re-use onsite. However, process upsets, incidental releases, and/or historical waste management practices (prior to the development of recovery/purification processes in the early 1900s) could have introduced spent acid containing dissolved lead to soil.

2.2.1 Lead Fate and Transport

A toxicological profile of lead completed by the Agency for Toxic Substances and Disease Registry (ATSDR 2007) found that at approximately neutral pH, lead predominately binds to carbon forming organic carbon-lead complexes. This form of lead is not bioavailable if consumed by ecological receptors. At low pH, dissolved lead in ions and ion pairs were the predominant species identified. ATSDR concluded that the mobility of lead increases in environments with low pH due to the enhanced solubility of lead under acidic conditions. Most lead is retained strongly in soil, and very little is transported through runoff to surface water or leaching to groundwater except under acidic conditions (ATSDR 2007). Bioavailability of lead in soil to plants is limited because lead strongly adsorbs to soil organic matter; however, the bioavailability increases as pH and organic matter content of soil are reduced. Plants and animals may bioconcentrate lead, but biomagnification of lead in higher level ecological receptors has not been observed (ATSDR 2007).

The EE/ERA conservatively assumed that COPECs are completely absorbed into an organism's gastrointestinal tract and enter the bloodstream where they can cause adverse effects. Kaufman et al. (2007) provide gastric models for both birds and mammals to evaluate the proportion of lead that mobilizes into the digestive juices (bioaccessible fraction) from soil, earthworms, and vegetation collected at a rifle and pistol range. Results for the avian gastric model suggest that the bioaccessible fraction of lead in soil was 53% and in earthworm tissue was 73% (Kaufman et al. 2007). For the mammalian model, the bioaccessible fraction of lead in soils was 66%, in earthworm tissue was 77%, and in unwashed vegetation was 50% (Kaufman et al. 2007). These results were incorporated into the upper trophic level exposure models presented in the ERA Work Plan.

2.2.2 Development Area - Experimental Dynamite Production Area

Established in 1915, the Development Area (**Figure 4**) housed research and quality control activities related to the development and improvement of propellants and explosives produced onsite. The EDPA (AoE-1) produced and tested formulations of dynamite within the Development Area. NG, a component of dynamite, was manufactured in the NG Area and transported in small batches to the EDPA. EDPA structures supporting formulation and mixing of dynamite were known to have lead floors, conveyances and equipment.

AOCs with lead concentrations exceeding the SSESC for lead (488 mg/kg) in soil in AoE-1 include:

- K5-1 – Drum Disposal Area
- K5-2 – Pond
- J5-5-04 – Old Decon Oven
- K6-9214 – Storehouse #4
- L5-4 – Dynamite Test Shed
- L5-6 – Stressed Vegetation
- L5-8318 – Dynamite Test House

Potential sources of lead in these AOCs include, but are not limited to, the following:

- Non-sparking and anti-static floor and wall covering (i.e., lead sheeting)
- Non-sparking and anti-static process equipment and conveyances
- Containers/vessels used during detonation testing

Release mechanisms associated with the sources of lead above include, but are not limited to, the following:

- Test detonations
- Process upsets (i.e., fire, explosions)
- Thermal decontamination
- Accidental releases (i.e., spills)

During the February 27, 2018 field reconnaissance site visit, lead sheeting as well as lead and copper debris (pictured below) were found on the ground surface in the EDPA.

Lead sheeting

Lead and copper debris material

The distribution of lead in AoE-1, as characterized during SI/RI sampling, indicates individual isolated areas of lead concentrations indicative of elemental lead chunks in soil among a majority of samples with concentrations at or below the SSEPC for lead (488 mg/kg) in soil.

Lead in AoE-1 has likely remained in solid form (i.e., lead sheeting in surface soil). Neither historical processes nor current conditions are expected to influence the form or solubility of lead in surface soil. Three groundwater samples were collected in 2013 (2 samples) and 2016 (1 sample) from an adjacent monitoring well (MW-3A) (**Figure 4**). Lead was not detected above the NJDEP groundwater quality standard in groundwater samples collected during the 2013 and 2016 sampling events (**Table 6**) In addition, historical data from 2005 show that lead was not detected in samples collected from MW-3A or a nearby monitoring well (MW-4). These data support the fate and transport model indicating that elemental lead in surface soil is insoluble and not influencing groundwater.

However, further evaluation of the physical form, speciation, and extent of lead in AoE-1 is recommended to assess the bioavailability of lead to ecological receptors.

2.2.3 Development Area - Ballistics Range

The Ballistics Range (AoE-2, **Figure 5**) tested propellant (i.e., smokeless powder) formulations to achieve manufacturer-specified projectile velocities. During test firing on the range, projectiles impacted a backstop constructed of timber and sand. Historical Facility knowledge regarding range maintenance practices indicates that spent shotgun shells and lead shot were periodically collected at the firing station and backstop, respectively, and stockpiled near the Bullet Kiln for recycling (lead) and/or disposal. When sufficient material accumulated in this area, offsite disposal was coordinated. Remnants of these stockpiles remained following cessation of Facility operations.

AOCs with lead concentrations exceeding the SSEPC for lead (488 mg/kg) in soil in AoE-2 include:

- H5-8126 – Ballistics Building
- I5-2 – Bunker
- I5-3 – Bullet Kiln
- I5-5 – Front Face of Shooting Plate
- I6-11 – Stressed Soil Area

Potential sources of lead in these AOCs include, but are not limited to, the following:

- Lead bullets and shot
- Lead particulates generated during projectile impact with the backstop
- Solid debris generated during testing activities

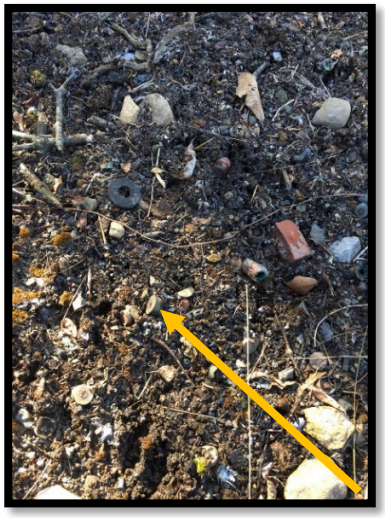
Release mechanisms associated with the sources of lead above include, but are not limited to, the following:

- Historical disposal/management practices
- Natural environmental processes (i.e., erosion)

During the February 27, 2018 field reconnaissance site visit, a shooting plate, spent casings, flattened lead bullets and shot were found in/on surface soil at the historical stockpile location. The photos below illustrate items found in AoE-2.

Shooting plate

Lead shot (identified in red box)



Shell casings

Based on the sources and release mechanisms discussed above, the location of lead detected in soil during SI/RI sampling, and evidence observed in the field, lead appears to be present in surface soil as a solid debris (e.g., projectile fragments). Lead concentrations consistent with soil containing lead projectile fragments (i.e., concentrations in the parts per thousand range) occurred around the Ballistics Building, Bullet Kiln, Bunker, and Backstop. Each of these AOCs historically handled or used lead projectiles. Three groundwater samples were collected in 2013 (2 samples) and 2016 (1 sample) from monitoring well MW-7PD, side-gradient to the AOCs within the Ballistics Range (**Figure 5**). Lead was not detected above the NJDEP groundwater quality standard in groundwater samples collected during the 2013 and 2016 sampling events (**Table 6**) Historical data from 2005 and 2006 sampling events did not identify lead in groundwater at wells MW-7PD and MW-7P (**Figure 5**). These data support the fate and transport model indicating that elemental lead in surface soil is insoluble and not influencing groundwater.

However, further evaluation of the physical form, speciation, and extent of lead in AoE-2 is recommended to assess the bioavailability of lead to ecological receptors.

2.2.4 PETN/NG Area – Acid Recovery & Former Ponds

The PETN Area and a majority of the NG Area make up AoE-3, while the NG Area - Former Ponds (remnant stormwater management features) represent AoE-4. The former PETN and NG operational areas of the Facility produced NG, and later PETN, from site development in 1871 through Facility closure. Both NG and PETN production processes relied heavily on concentrated nitric acid solutions. Given the sensitivity of NG to static electrical charges, building floors, process equipment and conveyances were typically lined with lead; and the production line was set on a hillside such that materials could be conveyed between processes

via gravity flow. The NG Area - Former Ponds occupy an area at the base of the hill and collected stormwater runoff during precipitation events.

AOCs with elevated lead concentrations include:

- C10-2 – PETN Crystallizer Tank Saddle
- C10-211C – Mixed Acid Storage
- C10-2179 – PETN Nitric Acid Store
- C10-3 – PETN Crystallizer Tank Saddle
- B11-1 – Acid Recovery Area
- B11-11 – Absorption Tower
- B11-2044 – Redford Paste House/Heater House Catch Tank
- C11-1 – Former Pond
- C11-10 – Coal Pile
- C11-12 – Unknown
- C11-15 – Shot Building
- C11-19 – Catch Tank House
- C11-2233 – Neutralizer #3
- C11-4 – Stressed Vegetation
- C11-8 – Stressed Vegetation
- D10-1 – Stressed Vegetation
- D10-164B – Waste Acid House
- D10-165B – Waste Acid House
- D10-2233B – Neutralizer #2
- D10-4 – Sucrose Nitrator
- D10-6 – Unknown

Potential sources of lead in these AOCs include, but are not limited to, the following:

- Non-sparking and anti-static floor and wall covering (i.e., lead sheeting)
- Non-sparking and anti-static process equipment and conveyances
- Corrosion-resistant coating/lining on tanks, equipment, and conveyances
- Spent acid waste streams

Release mechanisms associated with the sources of lead above include, but are not limited to, the following:

- Process upsets (i.e., fire, explosions)
- Thermal decontamination
- Accidental releases (i.e., spills)
- Historical disposal practices

- Surface-water and stormwater management practices (i.e., erosion, sedimentation)

Lead sheeting and lead debris were found on the ground surface in AoE-3 during the February 27, 2018 field reconnaissance site visit. The photos below illustrate lead material representative of what was observed in the Acid Recovery Area AOC (B11-11) and areas of stressed vegetation (AOCs C11-4, C11-8 and D10-1).

Lead sheeting

Lead exists in AoE-3 in both solid and potentially dissolved forms. Similar to the other AoEs, lead debris is present in soil as a result of facility operations. The mobility of lead increases in environments with a low pH due to the enhanced solubility of lead under acidic conditions (ATSDR 2007). Until the late 1800s there was not an established method to recover spent acids from nitrating explosive and energetic (E&E) constituents. Following the late 1800s an economical method of recovering spent acids was developed and they were no longer considered a waste material (Hercules 2007). The use of concentrated nitric and sulfuric acid in AoE-3 would have slowly eroded (via dissolution) lead equipment and materials, resulting in a spent acid solution containing dissolved lead. Over time, accidental discharges of acid solutions likely contributed to mobilizing lead from solid forms located in surface soil, as well as the transport of dissolved lead from the process stream to the environment. Additionally, acid releases reduced soil pH creating conditions under which lead in solid forms would more readily move into solution (ATSDR 2007).

Historical surface water management practices involved the collection and channelization of water, which flowed naturally from the PETN/NG Area hillside to the base of the hill. A series of depressions (unknown origin) exist at the base of the hill (NG Area - Former Ponds). Lead particulates present in surface soil and mobilized as suspended solids may have settled out and accumulated in these depressions.

These source – release mechanism combinations may have introduced lead into soil in both a solid, relatively immobile form (lead sheeting), or as more mobile lead particulates entrained in spent acid. One groundwater sample was collected in September 2016 from an adjacent monitoring well (MW-38) (**Figure 6**). Total lead was detected above the NJDEP groundwater quality standard in the groundwater sample collected during the 2016 sampling event (**Table 6**). A dissolved lead groundwater sample was not collected during this groundwater sampling event. During a 2006 sampling event, groundwater samples were collected from MW-38 and two additional wells in and near the NG area (MW-39 and MW-43). Total lead was not detected in these historical samples, and no dissolved lead data was collected.

Further evaluation of the physical form, speciation, and extent of lead in AoE-3 and AoE-4 is recommended to assess the bioavailability of lead to ecological receptors.

2.2.5 Maintenance Area - Acid Production Plant

The Maintenance Area – Acid Production Plant (AoE-5) produced sulfuric and nitric acids used to support various manufacturing processes onsite, as well as supply other nearby manufacturing installations. The Facility produced acids in this area from 1912 to 1950 (Hercules 2007). AOCs with lead exceedances include:

- H10-10 – Unknown Foundation
- H10-11 – Acid Mix Equipment
- H10-12 – Spent Acid Store Tank
- H10-14 - Unknown
- H10-16 – Unknown Concrete Footer
- H10-2003 – Spent Acid Tower
- H10-2092 – Spent Acid Recovery Tanks
- H10-267 – Absorption Tower
- H10-502 – Nitric Acid Recovery Area
- H10-503 – Sulfuric Acid Recovery Area
- H10-68 – Spent Acid Recovery
- H10-9002 – Oil Storage
- H10-9103 – Sulfuric Acid Store Tank
- H10-9104 – Nitric Acid Store Tank
- H10-9320 – Can Paint House

Potential sources of lead in these AOCs include, but are not limited to, the following:

- Corrosion-resistant coating/lining on tanks, equipment, and conveyances
- Spent acid waste streams

Release mechanisms associated with the sources of lead above include, but are not limited to, the following:

- Accidental releases (i.e., spills)

- Historical management and disposal practices

The lead dataset from AoE-5 exhibits the smallest range between minimum and maximum values, and highest median and 3rd quartile values; indicating that historical influences on soil are more widespread than in other AoEs. Lead debris has not been observed on the ground surface, indicating that lead likely occurs in a fine particulate or dissolved form. Despite the increased concentrations of lead in soil in AoE-5, dissolved lead was detected at concentrations less than the NJDEP GWQS in side-gradient groundwater monitoring wells MW-J2 and MW-J1 during a 2013 sampling event for those monitoring wells (**Figure 7** and **Table 6**). In 2016, total lead was detected at concentrations less than the NJDEP GWQS at MW-J2 and not detected at MW-J1. Despite historical influences in this area related to acid production and disposal, sampling events in 2013 and 2018 indicate that groundwater and soil pH in this area are circumneutral. Historically, lead was likely mobile throughout the maintenance area under acidic conditions, which have since been remediated by the natural buffering capacity of the soil and groundwater over time. The pH of groundwater and soil in the maintenance area support the interpretation that lead is no longer mobile throughout the site, but occurs in a fine particulate or dissolved form.

AoE-5 occurs within the footprint of Facility redevelopment. Redevelopment will function as a remedial cap (engineering control) and will eliminate potential ecological exposure pathways. As such, no additional investigation in this AoE is recommended at this time.

Section 3: Terrestrial Exposure Area

Section 2 outlined the dataset analysis used to identify clusters of lead concentrations in soil and define the five AoEs in which to focus additional ERA activities related to lead in the terrestrial exposure area. These five AoEs represent 206 of the more than 1,700 lead sample results in the terrestrial exposure area. This section evaluates potential ecological risk attributable to lead in the remaining terrestrial exposure area.

Building on the dataset analysis used to identify the AoEs, the remaining terrestrial exposure area (excluding areas of presumed remedial action) was evaluated using spatial data analysis in GIS. Specifically, the remaining terrestrial exposure area is defined as the terrestrial exposure area from the EE/ERA[1], less the five AoEs identified herein and areas of presumed remedial action. Beyond these baseline conditions, an additional evaluation that considers potential future redevelopment of the Facility was conducted to confirm that acceptable ecological risks exist in portions of the terrestrial exposure area that may not be subject to redevelopment.

3.1 Spatially-Weighted Exposure Point Concentration

Spatial weighting using Thiessen polygons was used to generate a lead EPC representative of the remaining terrestrial exposure area. Thiessen polygons are polygons whose boundaries define the area that is closest to each point relative to all other points. This approach incorporates the spatial distribution of samples within the exposure areas (i.e., higher density sampling results in a lower proportion of the overall exposure area represented by each sample result).

Baseline and redevelopment conditions were evaluated to ensure protectiveness of ecological receptors under current and future conditions. The redevelopment scenario is based on the current conceptual redevelopment plan and assumes that redeveloped areas would include a cover type that would eliminate potential ecological exposure pathways.

For each scenario, GIS was used to create Thiessen polygons around each sample location. The results of each sample were then weighted proportionally based on the fraction of the overall area represented by the corresponding polygon. In sample locations with non-detect values, the reporting limit was weighted proportionally based on the Thiessen polygon surrounding that location. Spatially-weighted EPCs based on the average and 95UCL were evaluated to provide a bounded range of risk estimates (HQs). HQs were calculated using the SSESC for lead in soil (488 mg/kg), back-calculated from the robin exposure model.

The following tables provide a data distribution summary and present HQs. **Appendix A** presents spatial weighting calculations (95UCL input and output files). **Appendix B** presents the datasets for the terrestrial exposure area current and future conditions (excluding redevelopment footprint) used for spatial weighting.

[1] The TNT Area boundary used in the EE/ERA has been updated to reflect the results of the 2017 refined delineation activities.

Lead SSESC	Arithmetic Average HQ (EPC)	Area-Weighted Average HQ (EPC)	Area-Weighted 95UCL HQ (EPC)
Terrestrial Exposure Area (Current Conditions)			
488	≤1 (497)	≤1 (381)	**2** (745)
Terrestrial Exposure Area (Excluding Redevelopment Footprint)			
488	≤1 (497)	≤1 (337)	**2** (857)

Units are in mg/kg

Area-weighted risk characterization results for the remaining areas onsite under both current and potential future conditions indicate that ecological risk attributable to lead is possible, but unlikely. The results of the bioavailability evaluations in each AoE will provide insight into the potential influences of lower lead concentrations elsewhere in the terrestrial exposure area, as well as the degree and direction of uncertainty associated with the assessment presented above.

Section 4: Field Sampling Plan

This section presents field activities proposed to inform a refined risk characterization for AoEs within the terrestrial exposure area. Field sampling and analysis activities will be conducted in accordance with the *Final Field Quality Assurance Project Plan* (FQAPP; Hercules, 2006) and the *Final Analytical Quality Assurance Project Plan* (AQAPP; Hercules, 2005) approved by NJDEP.

The following documents will supplement the procedures established in the QAPPs.

- Kennedy/Jenks Standard Operating Guidelines (**Appendix C**) addressing field tasks specific to this work plan
- Facility-specific Health and Safety Plan Addendum
- NJDEP's Data of Known Quality Protocol (DKQP; NJDEP 2014) providing supplemental data quality control procedures.

4.1 Scope Overview

The CSMs for each AoE presented in Section 2 identify the potential sources and release mechanisms from which lead was introduced to surface soil at the Facility. While the CSMs provide information regarding fate, transport, and bioavailability of lead in soil based on anecdotal and visual observations, additional data is needed to verify the CSM and provide additional lines of evidence regarding potential risk to American robin. Supplemental data collection will target the four AoEs (AoEs 1, 2, 3 and 4) outside the footprint of redevelopment, and focus on:

- Assessing the extent of lead influences on surface soil samples taken at and surrounding SI/RI soil sample locations using X-ray fluorescence spectrophotometry (XRF) analysis
- Confirming and supplementing existing soil chemistry data via analysis of total lead in soil
- Evaluating the speciation and bioavailability of lead in soil via sequential extraction procedure (SEP) analysis
- Quantifying the bioaccumulation potential of invertebrate prey items in the American robin's diet, if SEP analysis indicates lead may be bioavailable in soil.

4.1.1 Rationale and Data Use Objectives

The EE/ERA conservatively assumed that lead was 100 percent bioavailable. The ERA Work Plan refined risk evaluation incorporated measures of bioaccessibility from field studies presented in peer-reviewed scientific literature (Kaufman et al. 2007), resulting in a lead HQ_{LOAEL}

for robin of 3. The bioaccessibility values from Kaufman et al. (2007) were developed through studies at a rifle range, where lead was present in bullet fragments and particulates generated during projectile impact. Lead debris observed in the AoEs is present in similar (e.g., ballistics range) and larger (e.g., remnant sheeting) forms, as well as in fine particulates mobilized via the historical uses of acids. These AoEs are targeted for additional investigation to further refine risk estimates for American robin.

Specifically, XRF will be used to quickly quantify the extent of lead across the AoE, focused on areas of historically high lead concentrations. Based on XRF results, sample volume for laboratory analysis (total lead, TOC, pH, grain size, and SEP) will be collected from a subset of surface soil sample locations to confirm historical sample results, supplement existing data, and to evaluate speciation and bioavailability of lead in soil. If SEP results identify that lead in soil is bioavailable, terrestrial invertebrate sampling will be conducted to provide current and site-specific inputs for the American robin food web models.

The remainder of Section 4 presents specific tasks that will be completed during implementation of the TLWP.

4.2 Sample Location Selection

Proposed sample locations in each AoE are focused around SI/RI sample locations with elevated lead concentrations. Sample location selection will follow a stepwise process:

- Prior to sampling, KJ field personnel will use a handheld differential global positioning system (GPS) unit with sub-meter accuracy to field-locate SI/RI sample locations.
- Guided by the location of SI/RI sample results, a proposed primary sample location will then be selected, giving consideration to areas with visual evidence of lead in surface soil and/or operational influences (e.g., visible lead debris, areas devoid of vegetation). A sample will be collected at that location.
- In addition, step-out samples will be collected at 15ft and 30ft from the initial sample location in four cardinal directions (or directions aligned with the Facility grid). These step-out distances may vary based on field observations and conditions (e.g., stressed vegetation, surficial debris).

The step-out sampling approach is intended to collect soil samples from each AoE to evaluate bioavailability of lead across concentration ranges, as follows:

- Less than 488 mg/kg
- Between 488 and 800 mg/kg
- Between 800 and 1,500 mg/kg
- Between 1,500 and 5,000 mg/kg
- Greater than 5,000 mg/kg

The following values form the basis of the lower ranges provided above; the upper ranges are general incremental increases intended to support rapid visual assessment of source area distribution.

- The site-specific, back-calculated ecological screening benchmark for upper trophic level wildlife (488 mg/kg)

- NJDEP's Non-Residential Soil Remediation Standard (800 mg/kg)

Proposed samples in each AoE are detailed below.

AoE	***No. Proposed Sample Locations***		
	Primary	***Step-Out***	***Total***
1 - Experimental Dynamite	5	40	45
2 – Ballistics Range	4	32	36
3 – Acid Recovery	5	40	45
4 – Former Ponds	2	16	18

Figures 8 through **10** illustrate proposed primary sample locations targeting AOCs within each AoE with SI/RI sample lead results exceeding the SSEPC. Step-out sample location selection will follow the stepwise process outlined earlier in **Section 4.2**. Sampling will follow the methods and analyses outlined in **Section 4.3**.

4.3 Sampling Methods and Analyses

In accordance with Ashland's and K/J's subsurface utility clearance policies, a New Jersey One Call markout will be coordinated by K/J personnel at least seven days in advance of land disturbance.

Figures 8 through **10** illustrate the proposed primary sample locations. Step-out locations will be identified based on field conditions and the guidance provided in Section 4.2. A handheld GPS unit will be used to record each sampling location. Horizontal coordinates will be referenced in feet to the North American Datum of 1983 New Jersey State Plane Coordinate System.

4.3.1 Soil Sampling

Soil sampling will target the top 6-inch interval (0 to 0.5 ft bgs) at each sample location. The sample interval represents the surface soil interval to which ecological receptors of interest are most likely to be exposed, as well as the soil interval most likely to contain lead released to the ground surface.

Soil sampling will be conducted in accordance with the current NJDEP FSPM (NJDEP 2005) and K/J SOGs (**Appendix C**). Soil samples will be collected by field personnel via a hand trowel or stainless-steel bucket auger. Sampling equipment will be decontaminated in accordance with procedures outlined in the FQAPP prior to use and between each sample location. Field personnel will empty the soil into a decontaminated stainless-steel bowl (or similar decontaminated, dedicated vessel, or disposable container).

The potential for lead ingestion via soil by American robin (representing insectivorous birds) is driven by the physical size of lead particles. The larger the particle, the less likely incidental ingestion will occur. Conversely, fine particles can adhere to food items and/or ingested during foraging. As such, soil samples will be sieved such that the grain size fraction analyzed represents that with potential to be ingested. Grain size segregation is based on the processes outlined in USEPA's *Recommendations for Sieving Soil and Dust Samples at Lead Sites for Assessment of Incidental Ingestion* (2016) and modified based on receptor-specific information.

USEPA (2016) indicates that fines (less than 150 micrometer [µm]) represent the particle size range expected to adhere to objects and/or be ingested. When discussing lead introduced to soil at shooting ranges, Bennett et al. (2011) recommend selecting a soil fraction particle size range that includes the specific pellet/shot sizes used and present in soil. Given the various sources of lead and potential for lead to be present across a range of particle sizes, literature-based values for particle size ingestion in American robin and prey items, and sieving/sampling techniques established in USEPA-authored ERAs provide the basis for the sieving and sampling strategy below.

Specifically:

- Best (1995) identified 0.6 mm as the mean grit particle size ingested by American robin during studies of granular pesticides. Grit is expected to be the largest mineral particle ingested by birds.

- Bolton and Phillipson (1976) studied particle size distribution in the digestive tracts of earthworms and found that maximum sizes ranged from 0.1 to 0.3 mm dependent upon species and correlated to body size. Earthworms represent the prey item with the greatest potential (i.e., most conservative) to influence American robin dietary exposure via ingested soil exposure.

- USEPA and United States Fish and Wildlife (USFWS) (2004) sieved soil samples through 0.5 mm mesh prior to analysis for lead to estimate exposures for insectivorous birds (including American robin).

- Massachusetts Department of Environmental Protection (MDEP) (2009) indicates that, for ecological risk assessments of shotgun practice ranges, lead shot becomes part of the soil matrix at particle sizes less than 0.5 mm.

Based on this information, a No. 35 (0.5 millimeter [mm]) sieve will be used to separate soil that may be incidentally ingested by American robins during feeding or adhered to/ingested by their prey items.

Prior to performing XRF screening, soil samples from SI/RI locations will be placed in foil pans and dried in a drying oven to facilitate sieving and homogenization. Dried soil samples will be processed as follows:

1. Weigh the total sample

2. Sieve through 12.5-millimeter (mm) (0.5 inch) mesh

3. Sieve through No. 10 (2 millimeter [mm]) mesh
4. Sieve through No. 35 (0.5 mm) mesh
5. Combine the retained fractions and set aside (oversize)
6. Weigh the passing fraction (target)
7. Homogenize the passing fraction (target), divide into two equal parts (by mass)
8. Sieve one part through No. 100 (0.149 mm) mesh
9. Weigh both the retained (coarse) and passing (fine) fractions

The segregated grain size fractions will be processed as follows.

- The oversize fraction (Step 4) will be logged and photographed. Lead fragments in the oversize fraction, if present, will be separated and weighed.
- The target (Step 5) and fines (Step 8) fractions will be screened via XRF.

XRF methods and procedures will follow the FQAPP and K/J Metals Analysis Using X-Ray Fluorescence SOG (**Appendix C**).

Samples collected from locations established by the SI/RI results will be selected for laboratory analysis based on XRF screening results. For each AoE, XRF will help identify five samples corresponding to each of the five lead concentration ranges outlined in **Section 4.2**. Selected samples will be collected and submitted to Eurofins Lancaster Laboratories Environmental (ELLE) in Lancaster, Pennsylvania, a NJELAP-accredited laboratory. In the event that field observations and XRF screening identifies discrete area(s) within an AoE where the source of lead differs from that of other AOCs in the AoE, additional samples from this area(s) may be collected and submitted to ELLE.

Samples will be analyzed for the following:

- Lead via USEPA SW 846 Method 6020A
- pH via USEPA SW 846 Method 9040C
- TOC via USEPA SW 846 Method 5310C
- Grain size via ASTM International Method D422

ELLE will prepare Level 2 “reduced” laboratory data packages as required per N.J.A.C. 7:26E-2.1(a)16.ii.

QA/QC samples will include one field blank collected at the conclusion of each sampling day, and one blind duplicate sample and one MS/MSD sample collected per twenty field samples.

4.3.2 Sequential Extraction Sample Selection and Analysis

Upon receipt of sample analytical results from ELLE, total lead results from the laboratory confirmation samples will be evaluated to identify samples on which to run the sequential extraction procedure (SEP). Samples with total lead concentrations less than 488 mg/kg will not be considered for SEP analysis. For those remaining samples with total lead concentrations exceeding 488 mg/kg, three samples from each AoE will be selected. The samples will represent the maximum detected concentration, lowest concentration exceeding 488 mg/kg, and a sample nearest to the arithmetic average of those two samples.

Selected samples will be shipped to TestAmerica in Knoxville, Tennessee for SEP analysis via USEPA 6010B. The extractions will follow the 7-step process outlined in TestAmerica's 7-Step SEP Summary (**Appendix D**).

SEP results will report the concentration of lead partitioned across the seven fractions below.

Step 1 - Exchangeable Phase: a potentially bioavailable fraction where variations in soil chemistry can influence sorption and desorption.

Step 2 - Carbonate Phase: a fraction where lead is associated with carbonates, where mobility (and bioavailability) is a function of pH

Step 3 – Non-Crystalline Materials Phase: a fraction where lead is complexed with trace minerals, and mobility (and bioavailability) is a function of redox conditions in soil.

Step 4 - Metal Hydroxide Phase: a fraction where lead is bound as hydroxides, and mobility (and bioavailability) is a function of redox conditions in soil.

Step 5 - Organic Phase: a fraction where lead is strongly bound via chemisorption to organic material.

Step 6 - Acid/Sulfide Fraction: a fraction where lead is precipitated as sulfide minerals.

Step 7 - Residual Fraction: a fraction where lead remains strongly bound after the previous 6 extraction steps.

If SEP analysis indicates lead is bioavailable in soil at concentrations greater than SSESC, terrestrial invertebrate tissue data will be collected to provide site-specific inputs for the American robin food web model. Terrestrial invertebrate sample locations will be guided by total lead and SEP results.

4.3.3 Terrestrial Invertebrate Sampling

If SEP analysis results indicate lead in soil is bioavailable, terrestrial invertebrate sampling will be conducted to provide site-specific inputs for the American robin food web model. Common terrestrial invertebrates in an American robin's diet include beetles, caterpillars, moths, grasshoppers, spiders, millipedes, and earthworms (USEPA 1993). Terrestrial invertebrate sampling with consist of a combination of soil cores, pit traps and Berlese-Tullgren traps to obtain a representative sample of the terrestrial invertebrates in American robin's diet. Pit traps

are created by sinking a paint-style can (or similar size metal, glass, or plastic container) into the ground until the mouth is level with the soil. Invertebrates then fall into the can and are trapped. The can contains a preservative solution to trap, kill, and preserve invertebrates that fall into the trap (DERM 2009). A Berlese-Tullgren trap extracts insects from soil and litter samples. This technique uses a heat source to dry a leaf litter sample suspended in a funnel on a screen, the insects move away from the heat (deeper into the litter) where they fall through the screen and into a jar of preserving fluid below the funnel. Terrestrial invertebrate sampling will follow the procedures in the K/J Terrestrial Invertebrate Sampling SOG (**Appendix C**). Collected invertebrates will be segregated into two groups at each sample location – earthworms, and all other invertebrates. These groups will each represent a discrete sample and will be analyzed separately.

Tissue samples will be submitted to ELLE. Tissue samples will be analyzed for total lead using USEPA Method 6020A. ELLE will prepare Level 2 “reduced” laboratory data packages as required per N.J.A.C. 7:26E-2.1(a)16.ii.

4.4 Investigation-Derived Waste Management

Investigation-derived wastes (IDW) generated during field activities will include decontamination water, personal protective equipment (PPE) and dedicated/single-use soil sample collection equipment. PPE and sampling equipment that comes in contact with soil along with soil cutting and decontamination water will be stored in United States Department of Transportation (USDOT)-approved steel drums, labeled, and temporarily staged near the former wastewater treatment building.

K/J will coordinate directly with a Hercules-approved waste disposal facility (e.g., Tradebe) to profile and dispose of these materials at the conclusion of the project. Waste characterization samples will be collected for the soil cuttings and decontamination water separately and sent to ELLE for analyses requested by the selected disposal facility.

4.5 Schedule and Reporting

Field sampling is scheduled to occur during late summer/early fall 2018. Following receipt of results from Eurofins and TestAmerica, K/J will evaluate the data and present the results in an ERA addendum. The ERA addendum will summarize the results of the field sampling efforts, present a refined risk characterization, and provide conclusions and recommendations to support a scientifically-based management decision. The document will be submitted to the LSRP for review and approval.

Legend

- Remedial Area Boundary
- Road
- Former Building Outlines
- Area of Lead Enrichment (AoE) - Acid Recovery
- AoE - Former Ponds
- Proposed Sample Locations

Lead in Soil (0-2ft bgs)

- <488 mg/kg
- >488 - 800 mg/kg
- 800 - 1500 mg/kg
- 1500 - 5000 mg/kg
- >5000 mg/kg

Notes:
Units are mg/kg
mg/kg = milligrams per kilogram
ft = feet
bgs = below ground surface

0 30 60 120

Notes:

Results presented in milligrams per liter (mg/L)
NJDEP Groundwater Quality Standard for lead is 0.005 mg/L
U = lead not detected at the corresponding reporting limit
J = estimated concentration, results is less than the reporting limit, but greater than the method detection limit

				Numerical Average of Maximum Concentrations:		497.3
				Spatially Weighted Average:		380.50

Notes:
mg/kg = milligrams per kilogram
ft = feet

Appendix A-2
Spatial Weighting Calculcations - Terrestrial Exposure Area - Future Conditions (Excluding Redevelopment Area)
Kenvil Works Facility
Kenvil, NJ

Appendix C: Standard Operating Guideline Surface and Shallow Soil Sampling

C.1 Introduction

This guideline describes the equipment and procedures that are used by Kennedy/Jenks Consultants personnel for collecting surface and shallow soil samples.

C.2 Equipment

- Stainless steel or plastic scoops
- Hand auger
- Split-spoon drive sampler (2.5-inch or 2.0-inch I.D.) and associated drill rods, wrench and other tools needed to break down equipment
- Slide hammer
- 2.5-inch or 2.0-inch brass liners and sealing materials (plastic end caps, Teflon seals, silicon tape, zip-lock plastic bags)
- Shovel
- Post hole digger
- Pick
- Breaker bar
- Foxboro FID-Organic Vapor Analyzer (OVA)
- HNU PID-Organic Vapor Analyzer
- OVM
- Measuring tape or measuring wheel
- Stakes or spray paint for sampling grid
- Sampler cleaning equipment
  - Steamcleaner (if available)
  - Generator (if available)
  - Stiff-bristle brushes
  - Buckets
  - High priority phosphate-free liquid soap, such as Liquinox
  - Trisodium phosphate (TSD) for use if samples are oily
  - Methanol (if necessary)
  - 0.1N nitric acid (if necessary)
  - Deionized water
  - Potable water
- Insulated sample storage and shipping containers
- Personal protective equipment (as specified in site safety plan)

C.3 Typical Procedure

1. Obtain applicable drilling and well construction permits, prior to mobilization, if necessary.

2. Clear locations for underground utilities and structures by Underground Service Alert (USA) and subcontractors, if necessary.

3. Measure and mark sampling locations prior to initiation of the sampling program, as specified in the sampling and analysis plan. If sampling locations are based on a grid pattern, stakes can be used to define the grid layout.

4. Collect soil samples for chemical analysis by using precleaned scoops or a hand auger, or by driving a split-spoon drive sampler.

5. If overlying soil is to be removed (as specified in the sampling and analysis plan), use shovels, picks, or post-hole diggers, as needed.

6. Collect soil samples for lithologic logging purposes.

7. If applicable, as described in the site safety plan, use an OVA to analyze *in situ* air samples from the breathing zone and other locations as necessary.

8. Have the soils classified in the field in approximate accordance with the visual-manual procedure of the Unified Soil Classification System (ASTM D 2488-90) and the Munsell Color Classification (refer to SOG 21).

9. Prior to each sampling event, wash sampling equipment (scoops, hand auger, split-spoon drive sampler, and brass liners) with high purity phosphate-free soap. Double-rinse it with deionized water and methanol, and/or 0.1N nitric acid, as appropriate.

10. At each sampling interval, collect soil and place it in the appropriate sampling container. Fill the sample container and compact the soil to minimize air space. Minimize handling of the soil, especially if it is being collected for analysis of volatile compounds.

11. If a split-spoon drive sampler is being used, select one brass liner for potential laboratory analysis. Cover the ends of this sample in Teflon sheets, seal it with plastic caps, and wrap it with silicon or Teflon tape. Place a completed sample label on the brass liner.

12. Place the selected samples in appropriate containers and store them at approximately 4 °C.

13. As a field screening procedure (if applicable), for each sampling interval, place soil not selected for chemical analysis in an airtight container (e.g., plastic bag or jar) and allow it to equilibrate. After this, monitor the headspace in the container using either a HNU, OVM or OVA. Record the headspace concentration in the field notes (refer to SOGs 4 and 5).

14. Complete chain-of-custody forms in the field and transport the selected samples in insulated containers, at an internal temperature of approximately 4°C, to the analytical laboratory (refer to SOGs 3).

C.4 Equipment Cleaning

Prior to collection of each soil sample, the sampling equipment should be either steamcleaned or hand washed. If the sampling equipment is hand washed, wash excavation equipment with a brush, in a solution of high purity phosphate-free soap and potable water. Rinse the equipment with potable water and methanol, and/or 0.1N nitric acid, as appropriate. Follow this with double-rinsing using distilled water (refer to SOG 11).

C.5 Investigation-Derived Residuals

If sufficient volumes of soil cuttings and other residuals are generated, contain the material in appropriately labeled containers for disposition by the client. All soil samples transported to the laboratory must be returned to the client for disposition if required by the laboratory. Kennedy/Jenks Consultants is available to assist the client with options for disposition of residuals (refer to SOG 20B).

Appendix C. Standard Operating Guideline Metals Analysis Using Field Portable X-Ray Fluorescence

C.1 Introduction

This guideline identifies the procedures that will be used by Kennedy/Jenks Consultants personnel during operation of x-ray fluorescence (XRF) instruments for field screening/analysis of metals.

C.2 Equipment

- XRF Analyzer with data acquisition, processing, display and computer interface
- Testing stand
- Batteries and charger
- Sample cups (as specified by instrument)
- X-ray window film (as specified by instrument)
- Moisture content probe
- Elemental standards
- Equipment blank samples
- Method blank samples
- Calibration standards
- Mortar and pestle
- 0.25 mm sieve or finer to prepare samples
- Drying oven
- Electronic scale
- Plastic bags – collection and homogenization of samples
- Camera (video capable)
- Insulated sample storage and shipping containers
- Personal protective equipment (as specified in site safety plan)
- Field logbook
- Instrument manual
- Cleaning and decontamination supplies

C.3 Procedures

Sample Preparation

1. Measure sample contents inside zip lock bag with moisture content probe. If moisture content is greater than 20%, samples will be dried in an over prior to being sieved/homogenized.

2. Empty soil contents from sampling jar into labeled sample tray (or into a Ziploc type baggie if soil screening) and record sample information in field notebook.

3. Remove any debris (e.g., twigs, rocks) from sample.

4. If necessary due to soil characteristics (e.g., coarseness), grind sample using mortar and pestle.

5. Sieve contents using 0.25 mm sieve or finer to prepare the sample for measurement.

6. Place approximately 5 grams of sample contents into sample cups and cover tightly with x-ray window film.

7. Place sample cup under x-ray window according to manufacturer's instructions.

8. Clean sample preparation equipment according to decontamination procedures outlined in the work plan.

Calibration

1. Instrument calibration processes may incorporate any one of three types of procedures existing for XRF instruments: Fundamental Parameters calibration, empirical calibration, and the Compton peak ratio (or normalization method). The calibration procedure will be dependent upon the XRF instrument and data quality objectives (DQOs) specified. The calibration procedure in the instrument manufacturer's instructions should be followed for each specific instrument.

Sample Analysis

1. Don PPE, as required by the HASP.

2. Turn the analyzer on (per manufacturer's instructions).

3. Check battery life. If low, replace before proceeding.

4. Allow the analyzer to warm up for 15 minutes (per manufacturer's instructions).

5. Define the analyzer operating conditions in the instrument software (per manufacturer instructions). This will include entering target analytes, associated site-specific action limits (ALs), sample analysis time, and sample identification number, as appropriate or available.

6. Ensure that the appropriate materials required to perform energy calibration, calibration verification and blank analyses are available and the procedures are followed prior to or during sample analysis.

7. Remove the sample from the container and follow sample preparation procedure above.

8. Analyze samples according to specified target analytes and associated DQOs and following the instrument manufacturer's instructions. Based on the potential interference among certain analytes (e.g., Pb and As) and moisture content, sample analysis times will be determined based on the sensitivity of the XRF analyzer and level of resolution desired.

   Note: Depending on the instrument sensitivity and desired resolution (increasing the precision of the measurement), the analyzer may need to collect spectra from the soil samples from 30 seconds to a minute, or longer (5 minutes). Moisture in the samples being analyzed can cause spectral interferences and/or false elevated concentrations to be reported

9. Once the desired resolution and sensitivity has been met for the target analytes, end the analysis.

10. Remove sample cup from analyzer and return sample to the sample container.

C.4 Equipment Cleaning

Prior to the analysis of each sample, the sampling equipment should be decontaminated in accordance with the Equipment Decontamination SOG.

C.5 Investigation-Derived Residuals

Excess sample, sampling equipment and decontamination liquids generated, will be placed in appropriately labeled containers for disposal.

Appendix C: Standard Operating Guideline Terrestrial Macroinvertebrate Sampling

C.1 Introduction

This guideline describes the equipment and procedures that are used by Kennedy/Jenks Consultants personnel for collecting terrestrial macroinvertebrates in soil and leaf litter. The specific collection technique will be selected based on project specific data quality objectives.

C.2 Equipment

- Handheld global positioning (GPS) unit
- Shovel
- 1-gallon bucket or paint can
- Flagging
- 1-Gallon plastic jug or funnel (e.g., milk jug)
- 16 oz glass jar
- Mesh screen (1/4" hardware cloth)
- Ethyl acetate, Ethanol (70–95%) or Isopropanol (70%)
- Lamp with Moveable Neck (and incandescent bulb, for heat)
- Long handled tweezers
- Scissors
- Ruler
- Tape
- Collected soil sample and leaf litter
- Insulated sample storage and shipping containers
- Personal protective equipment (as specified in site safety plan)

C.3 Typical Procedure

1. Mark sampling locations with flagging and collect GPS coordinates at each location.

2. Measure the depth and width of the bucket or paint can and use a shovel to dig a hole that allows the container to fit.

3. Retain overlying soil and leaf litter for Berlese tullgren sampling.

4. Place the container in the hole and ensure it is flush or slightly above the ground surface. Cover the lip of the container with soil.

5. Place a small layer of soil or leaf litter in the bottom of the trap for incidental reptile and amphibian capture.

6. Use care when checking traps and use long handled tweezers or similar to check leaf litter for venomous/biting/stinging insects and reptiles. Remove unwanted species.

7. Empty terrestrial invertebrates collected in the traps into glass sample jars with lids. Tape a sponge soaked in ethyl acetate to the side of the container to euthanize invertebrates for tissue sampling. Use ethanol or isopropyl in the jar to preserve invertebrates for community sampling.

8. Place a plastic funnel over a glass jar with mesh hardware cloth or window screen at the bottom. Add a few centimeters of ethanol or isopropyl in the bottom of the glass jar if preserving invertebrates for community sampling. Tape a sponge soaked in ethyl acetate to the inside of the jar for tissue sampling.

9. Tape a measuring stick to the gar and funnel so it doesn't tip over.

10. Place collected soil and leaf litter in the funnel and set the lamp over top of the funnel at least 10 centimeters away to allow for drying.

11. Once soil and leaf litter are dry remove funnel and seal jars. Complete chain-of-custody forms in the field and transport the selected samples in insulated containers, to the analytical laboratory.

C.4 Equipment Cleaning

Prior to collection of each invertebrate sampling location, the sampling equipment should be hand washed.Wash with a brush, in a solution of high purity phosphate-free soap and potable water. Rinse the equipment with potable water and methanol, and/or 0.1N nitric acid, as appropriate. Follow this with double-rinsing using distilled water.

C.5 Investigation-Derived Residuals

If sufficient volumes of soil and other residuals are generated, contain the material in appropriately labeled containers for disposition by the client. Kennedy/Jenks Consultants is available to assist the client with options for disposition of residuals.

Appendix C: Standard Operating Guideline Equipment Decontamination

C.1 Introduction

This guideline describes field procedures typically followed by Kennedy/Jenks Consultants personnel during the decontamination of sampling and monitoring equipment. Proper decontamination procedures minimize the potential for cross-contamination among sampling points on a single site or between separate sites.

C.2 Equipment

- Two or three containers (e.g., 5-gallon buckets, or 5- or 10-gallon plastic tubs) for dip rinsing, washing, and collection of rinse water.
- Two or three utility brushes or test tube brushes for removal of visible contamination. A test tube brush (or similar) can be stapled to the end of a dowel and used to clean the inside of a bailer.
- Non-phosphate Alconox, Liquinox, or trisodiumphosphate (TSP) to be mixed with potable or distilled water.
- Rinse solutions, such as methyl alcohol (methanol), dilute nitric acid (0.1 molar), deionized or distilled water, and/or tap water. Deionized water is preferable to distilled water because the deionization process typically results in greater removal of organic compounds as discussed below:

  Acid rinse (inorganic desorption) 10% nitric or hydrochloric acid solution reagent grade nitric or hydrochloric acid and deionized water (1% to be used for low carbon steel equipment).

  Solvent rinse (organic desorption isopropanol, acetone, or methanol; pesticide grade).

  Deionized water is preferable to distilled water because the deionization process typically results in greater removal of organic compounds.
- Multi-gallon storage containers filled with potable water to be used for rinsing or washing.
- Spray bottles, squirt bottles, or garden sprayers to apply rinse liquid. A separate bottle should be used for each liquid.
- Solvex or neoprene gloves that extend, as a minimum, halfway up the forearm. In cooler weather, it is advisable to use different resistant chemicals neoprene gloves that provide better insulation against cold temperatures.
- Paper towels to wipe off gross contamination.
- Garbage bags, or other plastic bags, and aluminum foil to wrap clean sampling equipment after decontamination, to store sampling equipment or and to dispose of decontamination debris.

- Sample bottles for rinsate blanks. For these blanks, Laboratory Type II (millipore) water should be used. Purified water from the selected analytical laboratory is recommended. This water is often filtered and boiled to remove impurities.

- DOT-approved container (e.g., 55-gallon drum) to store contaminated wash and rinse water. Contained decontamination should be labeled appropriately.

- Steamcleaner with power source and water supply.

C.3 Procedures

In most cases, the following procedures are adequate to remove contamination.

1. Preclean sampling equipment. If there is gross contamination on equipment, wipe it off with paper towels and/or rinse it off with water. Additional internal decontamination may be possible by circulation of water or cleaning solutions.

2. Wash all parts of equipment with detergent water and scrub with brushes. Take equipment apart when appropriate to remove visible contamination.

3. Steamclean sampling equipment. The steamcleaner is effective in removing contamination, especially volatile hydrocarbons. Steamcleaning is highly recommended in most cases and sometimes is the only method for decontaminating equipment that is grossly contaminated with hydrocarbons.

4. Rinse equipment by dipping in rinse solution, spraying, or pouring solution over it. Dip rinsing can introduce contaminants into solution. Spraying might not allow a thorough rinsing of the equipment, but it is a more efficient rinsing method because less rinse solution is used. Appropriate rinsing solutions are specified in the project sampling and analysis plan. Some typical solutions are indicated in the equipment section of this SOG.

   Methanol (used to remove organic compounds)

   Dilute acids (used to remove metals and other cations)

   Tap water

   Deionized/distilled water.

5. Rinse the sampler with generous amounts of deionized water. Pouring water over the sampler is best, although spraying or using a squirt bottle to apply rinse water might be adequate if you are trying to minimize waste.

6. Prepare rinsate blanks. To ensure proper decontamination, submit a rinsate blank for analysis. It is best to do this just before sampling. The blank should be analyzed for the same chemicals the samples are being checked for and for the chemical used to decontaminate equipment, if appropriate.

   [Note: The heading for this section indicates procedures to remove contamination.]

To prepare a rinsate blank, pour millipore analyte-free water through or over the into the sampler. Collect the rinsate water in a clean bottle. Pour the collected rinsate water into the appropriate sample container(s). It is advisable to prepare one rinsate blank every day in the field. Use water specifically for blank preparation.

7. Wipe sampling equipment with a paper towel or allow it to air dry.

8. Place samplers in clean plastic bags or sealed containers, or wrap them in aluminum foil for storage in an undisturbed location that is free of contamination.

C.4 Investigation-Derived Residuals

For details of handling investigation-derived residuals refer to the project sampling and analysis plan.

C.5 Special Notes

- To reduce the potential for cross-contamination, samples should be collected so that the least contaminated stations areas are sampled first. Subsequent sampling should be completed in the order of increasing contamination. Areas that typically have lower levels of contamination include those upgradient of source, background areas, and the periphery of the contaminated area.

- Prepare rinsate blanks. To ensure proper decontamination, submit a rinsate blank for analysis. It is best to do this just before sampling. The blank should be analyzed for the same chemicals the samples are being checked for and for the chemical used to decontaminate equipment, if appropriate.

- To prepare a rinsate blank, pour analyte-free water through or into the sampler. Pour the collected rinsate water into the appropriate sample container(s). It is advisable to prepare one rinsate blank every day in the field. Use water specifically for blank preparation.

- Monitoring instruments that come into contact with sampled materials must be decontaminated, along with sampling devices. They should be washed, or at least rinsed before monitoring other sampling sites.

- As determined from analysis of rinsate blanks, decontamination using soap and water is adequate in removing detectable quantities of contaminants. This type of decontamination has been compared to laboratory procedures for decontaminating sampling bottles. Using methanol as a rinse does help in cases of contamination with organic compounds.

Sequential Extraction Procedures (SEP) For Up To Twenty Three Metals in Sediment and Soil

Introduction

Sequential extraction procedures are a valuable and validated method of investigating metal concentrations in sediment and soil. For sediments and soils, reductions in metal concentrations and/or toxicity typically occur through dispersion, dilution, sorption and/or redox processes. One way to determine the geochemical fractionation of these metals in laboratory scale operations is through the use of a SEP.

TestAmerica Knoxville is at the forefront of developing various SEPs for metals. The lab has analyzed more than 150 samples over the last three years for as many as 23 different elements including those listed in the Contract laboratory Program (CLP) target analyte list (TAL). TestAmerica Knoxville's SEP approach is a form of the method evaluated for radionuclides by the National Institute of Standards and Technology (NIST) speciation workshop.

A wide variety of SEP methods have been developed to target metals bound to specific functional fractions of soil and sediment. The data allow clients to evaluate the geochemical relationships that are used to understand the conditions under which contaminants may be released to the surrounding environment. SEP methods define each fraction based on the way in which metals are bound to the substrate and the types of metallic compounds that are formed. The advantage of the SEP for metals is that it provides a more holistic picture of metals chemistry in environmental media. SEP is most useful for sediments and sources in transitional states where understanding chemical form will aid in predicting fate, transport, and bioavailability.

Existing studies provide numerous examples of how fractionation data from SEP can be used to enhance estimates of bioavailability and toxicity, predict metal fate and transport under expected conditions, and refine sediment management and remediation options. While this procedure cannot be used to identify the actual speciation of a given metal in a sediment or soil, it is useful in grouping metals into immobilization phases or fractions. SEP data have been used to:

- Identify causes of observed toxicity in cases where total metals data fails to be predictive;
- Predict potential metal releases from dredged sediment as it undergoes oxidation and to quantify associated risks;

- Gauge the likely success of remedial strategies that are based on regulating contaminant mobility;
- Refine wildlife exposure estimates in risk assessments;
- Assess natural attenuation as a remedial action alternative;
- Develop benchmarks for use in remediation.

Quality control associated with SEP Analysis

TestAmerica Knoxville developed a SEP method that incorporates the blank and check samples typically associated with a rigorous promulgated method. TestAmerica's quality assurance (QA) program is incorporated into the method to include the following quality control samples in each batch of samples prepared using the SEP: method blanks, laboratory control sample/laboratory control sample duplicates and a laboratory duplicate.

Summary of the Procedure

The specific SEP steps vary based on the data needs of each project. The seven potential steps in the TestAmerica Knoxville SEP are presented below. In each step, the sediment or soil is extracted sequentially and the resulting sample residue is digested using method 3010A and analyzed by method 6010B and/or 7470A and reported on a dry weight basis.

The Seven Potential Steps for SEP Metals

- **Step 1 -Exchangeable Fraction**: An aliquot of sample is extracted with 1M MgSO4, centrifuged and filtered.
- **Step 2 -Carbonate Fraction**: The sample residue is extracted in 1M NaOAc/HOAc, centrifuged and filtered.
- **Step 3 -Non-crystalline Materials Fraction**: The sample residue is extracted with ammonium oxalate, centrifuged and filtered.
- **Step 4 -Metal Hydroxide Fraction**: The sample residue is extracted with 1M hydroxylamine hydrochloride solution in acetic acid, centrifuged and filtered.
- **Step 5 -Organic-bound Fraction**: The sample residue is extracted three times with NaClO, centrifuged and filtered.
- **Step 6 -Acid/Sulfide Fraction**: The sample residue is extracted with a solution of HCl-HNO3-H2O, centrifuged and filtered.
- **Step 7 -Residual Fraction**: An aliquot of the sample residue is digested using HF, HNO3, HCl and H3BO3.
- **Totals**: A 1.0 gram aliquot of the original sample is digested using HF, HNO3, HCl and H3BO3.

The results obtained from the SEP are compared with the total metal levels. The cumulative concentration of metals extracted sequentially by the seven SEP steps generally agrees very well with the total metals results.

Sample Size/Mass, Bottle Requirements and Holding Times

The sample holding time for metals is 180 days for the ICP metals and 28 days for mercury from the date of collection to the date of analysis. A minimum of 10 grams of sample material is needed for analysis. TestAmerica recommends using a 125 ml (4 oz.) wide mouth clear glass container.

Soil or sediment samples do not require preservation but may be stored at 4 °C ± 2 °C until the time of sample preparation.

TestAmerica Knoxville
7 Step Sequential Extraction Procedure Summary

Step 1 - Exchangeable Phase: This extraction includes trace elements that are reversibly sorbed to soil minerals, amorphous solids, and/or organic material by electrostatic forces. These forces may be overcome by exposing the soil to a concentrated electrolyte solution, such as 1M $MgSO_4$ that displaces the trace elements from solid surfaces.

Exposure Time/Temperature: 1 hr/ambient.

Step 2 - Carbonate Phase: This extraction targets trace elements that are sorbed or otherwise bound to carbonate minerals. This phase is soluble in a mild acid solution (1M NaOAc solution in 25% HOAc at pH 5).

Exposure Time/Temperature: 3 hr/ambient.

Step 3 – Non-Crystalline Materials Phase: This extraction targets trace elements that are complexed by amorphous minerals (e.g. iron). This phase is extracted with 25 mL of 0.2M ammonium oxalate (pH 3).

Exposure Time/Temperature: 4 hr/ambient.

Step 4 - Metal Hydroxide Phase: Trace elements bound to hydroxides of iron, manganese, and/or aluminum are extracted using a solution of 1M hydroxylamine hydrochloride in 25% v/v acetic acid.

Exposure Time/Temperature: 6 hr/ 95°C $\pm$ 5°C.

Step 5 - Organic Phase: This extraction targets trace elements strongly bound via chemisorption to organic material. Oxidation of soil organic matter (using pH 9.5; at 5% NaOCl), will bring into solution metals bound to organic functional groups.

Exposure Time/Temperature: 1 hr/ 95°C $\pm$ 5°C.

Step 6 - Acid/Sulfide Fraction: The extraction is used to identify trace elements precipitated as sulfide minerals. Metals associated with sulfide minerals will be extracted by leaching the soils with a 3:1:2 v/v solution of HCl-HNO_3-H_2O to dissolve the metal sulfide minerals.

Exposure Time/Temperature: 1 hr/ 95°C $\pm$ 5°C.

Step 7 - Residual Fraction: Trace elements remaining in the soil after the previous extractions will be distributed between silicates, phosphates, and refractory oxides. These residual metals can be removed from the soil through total dissolution with HF, HNO_3, HCl and H_3BO_3.

Exposure Time/Temperature: 3 hr/ 95°C $\pm$ 5°C.

Body Weight (kg)	Dietary Composition	Dietary Composition					Daily Ingestion Rate (kg/day)	Soil Ingestion Rate (kg/day)	SUF	Daily Dietary Dose (mg/kg/d)	Soil Bioaccessible Fraction	Worm Bioccessible Fraction	TRV (mg/kg-d)	EPC (mg/kg)	HQ
	Inverts	Plants	BAF_{invert}	BAF_{plant}	C_{invert} (mg/kg)	C_{plant} (mg/kg)							LOAEL		LOAEL
0.081	37.5%	62.5%	e^(0.807 * LN(Cinvert) - 0.218)	e^(0.561 * LN(Cplant) - 1.328)	118.73	8.54	0.016	0.003	0.67	11.3	0.53	0.73	11.3	**488**	0.99999

Notes:

Equation:

$$EPC = \frac{HQ_{LOAEL} \times TRV \times BW}{SUF \times \left(IRsed + \left[IRfood \times \left[\left(BAF_{invert} \times \%diet\right) + \left(BAF_{plant} \times \%\,diet\right)\right]\right]\right)}$$

EPC = exposure point concentration
TRV = toxicity reference value
BW = body weight (kg)
SUF = site use factor
IRsed = Sediment Ingestion Rate (kg/day)
IRfood = Daily Ingestion Rate (kg/day)
BAF = Bioaccumulation Factor
%diet = Dietary Composition

Updated Screening Summary & Recommendations Package

Summary of Findings – ERAWP Desktop Evaluation					
Subarea	Original Screen (SEL)	Original Risk Characterization	Updated Screen (LEL)	Updated Risk Characterization & Rationale	Recommendations
Northern Drainage Area					

Northeast Ponds	--		Cu, Pb, Zn Pyrene, Phenanthrene	<u>Metals:</u>
				• AVS/SEM results correlated strongly to OC content
				• 24/24 samples with OC > 0.1% yielded results <130 µmol/g
				• NE Ponds OC content range: 3.9 to 54%
				• Lower COPEC concentrations, similar OC content
				• Feature in undisturbed/undeveloped area beyond operational influence
				
				<u>PAHs:</u>
				• 3/6 detections for Pyrene and Phenanthrene
				• Conservative EqP approach using 13-PAH dataset and CF
				  • 1 of 6 ESBTU > 1 with 95% correction factor (high detection limits for SD-R2-O-4-1 where ESBTU = 2.34, used ½ detect limit for PAHs ND)
				  • 5 of 6 ESBTUs < 0.5
				• Comparison to CDB 34-PAH ESBTU
				  • 34-PAH ESBTU = 1.0, using same dataset 13-PAH ESBTU = 8.83
				  • 0 of 6 NE Ponds 13-PAH ESBTU > 8
					No further investigation

Western Tributary*	--		Cd, Cu, Pb, Hg, Zn	<u>Divalent Metals (Cd, Cu, Pb, Zn):</u>
				• AVS/SEM results correlated strongly to OC content
				  • 24/24 samples with OC > 0.1% yielded results <130 µmol/g
				• 3 separate features make up Western Trib subarea
				  • Western Tributary
				  ▪ OC content range: 0.98-29% (Average: 11.25%)
				  ▪ Cd, Cu, Zn max detect SD-R-K5-10 OC: 7.5%
				  ▪ Pb max detect SD-R-L5-11 OC: 20%
				  • K5-1 Pond
				  ▪ OC content range: 0.4-18% (Average: 7.69%)
				  ▪ Cd, Cu, Pb, Zn max detect SD-R-K5-18 OC: 11%
				  ▪ Zn HQ LEL ≤ 1 in this feature
				  • Unnamed stormwater feature along Patrol Rd
				  ▪ OC content range: 0.29-29% (Average: 10.8%)
				  ▪ Cd max detect SD-R-K5-09 OC: 29%
				  ▪ Cu max detect SD-R-K5-17 OC: 3.4%
				  ▪ Pb, Zn max detect SD-R-K5-20 OC: 15%
				
				<u>Mercury</u>:
				• Max detected concentrations is less than the lowest NOEC in Conder et al. (2015)
					No further investigation

Summary of Findings – ERAWP Desktop Evaluation					
Subarea	Original Screen (SEL)	Original Risk Characterization	Updated Screen (LEL)	Updated Risk Characterization & Rationale	Recommendations

Duck Pond	--		As, Cd, Cu, Pb, Hg, Zn, PAHs	<u>Arsenic:</u>
				• 95UCL consistent with local background threshold value soil concentrations (see Attachment 1)
				
				<u>Mercury</u>:
				• Max detected concentrations is ~20% of the lowest NOEC in Conder et al. (2015)
				
				<u>Divalent Metals (Cd, Cu, Pb, Zn):</u>
				• AVS/SEM results correlated strongly to OC content
				  • 24/24 samples with OC > 0.1% yielded results <130 µmol/g
				• Duck Pond OC content range: 2.5 to 30%
				• Lower COPEC concentrations, similar OC content
				• Areas of sediment metals enrichment along shoreline to be removed to address potential human health exposures
				
				<u>PAHS:</u>
				• 34-PAH datasets unavailable in Duck Pond; conservative approach using 13-PAH dataset and CF
				• ESBTU calculation using 13-PAH dataset (ND@0.5DL):
				  • ESBTUs: 0.47 to 4.6 (n=8)
				• Comparison to CDB 34-PAH ESBTU
				  • 34-PAH ESBTU = 1.0, using same dataset 13-PAH ESBTU = 8.83
				  • 0 of 8 Duck Pond 13-PAH ESBTU > 8
					No further investigation

Eastern Tributary	--		Cu, Pb	<u>Divalent Metals (Cu, Pb)</u>: • AVS/SEM results correlated strongly to OC content • 24/24 samples with OC > 0.1% yielded result <130 µmol/g • Eastern Trib OC content range: 0.6 to 7.3% (Average: 2.57%) • Low OC samples (n=2) collected from bottom of Shooting Pond along sheetpile wall – consolidated sediment bottom, not suitable to support infaunal benthic community	No further investigation

Unnamed Ponds*	Pb, Hg, Zn	<u>Divalent Metals (Pb, Zn):</u>
		• AVS/SEM ratios <130 µmol/g
		• No further evaluation recommended
		• Benthic community survey proposed for Hq will provide supplemental LoE
		
		<u>Mercury:</u>
		• HQs greater than 1 using NJDEP ESC
		• HQ less than 1 based on lowest NOEC value in Conder et al. (2015)
		• Benthic community survey recommended to provide additional line of evidence
			As, PAHs, Cd, Cu	<u>Arsenic:</u>
				• Max detected concentration consistent with As observed in historic fill material at other areas of the Facility
				• Average As concentration greater than Facility background threshold average concentrations (see Attachment 1)
				• Benthic community survey proposed for Hq will provide supplemental LoE
				
				<u>Metals:</u>
				• Rely on existing data
				• AVS/SEM ratios <130 µmol/g
				• Benthic community survey proposed for Hq will provide supplemental LoE
				<u>PAHs:</u>
				• 34-PAH datasets unavailable in Unnamed Ponds; conservative approach using 13-PAH dataset and CF
				• ESBTU calculation using 13-PAH dataset (ND@0.5DL):
				  • ESBTUs: 0.68 to 4.0
				• Comparison to CDB 34-PAH ESBTU
				  • 34-PAH ESBTU = 1.0, using same dataset 13-PAH ESBTU = 8.83
				  • 0 of 4 Unnamed Ponds 13-PAH ESBTU > 8
				• Benthic community survey proposed for Hq will provide supplemental LoE
					Benthic community survey (focused on assessment of Hg per previous recommendations)

Summary of Findings – ERAWP Desktop Evaluation					
Subarea	Original Screen (SEL)	Original Risk Characterization	Updated Screen (LEL)	Updated Risk Characterization & Rationale	Recommendations
Southern Drainage Area					
Development	--		As, Pb, Hg	Pb: • AVS/SEM results correlated strongly to OC content • 24/24 samples with OC > 0.1% yielded results <130 µmol/g • Development OC range: 0.091 – 5.2% (average: 1.98%) • OC content at location of Pb max detect: 0.3% • Lower Pb concentrations, similar OC to MNG (0 of 3 AVS/SEM samples > 130) Mercury: • 10/14 detections, 4 exceedances of LEL, 0 exceedances of SEL • Max detected concentration and 95UCL below lowest observed NOEC in Conder et al. (2015) Arsenic: • 95UCL consistent with local background threshold value soil concentrations (see Attachment 1)	Arsenic, Pb, Hg: no further investigation

Maintenance-Dynamite East* (MDE)	--		Cu, Pb, Mn, Hg, PAHs, Cr, Ag	Divalent Metals (Cu, Pb; incl. monovalent Ag):
				• Similar conditions to Maintenance-NG Ditches (3 AVS/SEM samples, ratios less than 130 µmol/g)
				• AVS/SEM results correlated strongly to OC content
				  • 24/24 samples with OC > 0.1% yielded result <130 µmol/g
				  • OC content range in MDE: 0.03-7.9%, with 2.3% average (n=46)
				
				Chromium:
				• Toxicity and bioavailability based on valence state, sediment conditions generally favor less mobile and less toxic trivalent state
				
				Manganese:
				• Small dataset (n=6), single elevated detection (7xSEL), remaining values less than LEL
				• Location of max detect is at former rail crossing culvert/area of historic fill material
				
				Mercury:
				• Max detected concentrations is within range of NOECs in Conder et al. (2015)
				• 95UCL is less than the lowest NOEC in Conder et al. (2015)
				
				PAHs:
				• 34-PAH datasets unavailable in MDE; conservative approach using 13-PAH dataset and CF
				• ESBTU calculation using 13-PAH dataset (ND@0.5DL):
				  • ESBTUs: 0.83 to 13.2
				• Comparison to CDB 34-PAH ESBTU
				  • 34-PAH ESBTU = 1.0, using same dataset 13-PAH ESBTU = 8.83
				  • 2 of 4 MDE 13-PAH ESBTU > 8
					Cu & Pb; Ag; Cr: Sediment sampling for AVS/SEM, Cr speciation
					
					Mn & Hg: no further investigation
					
					PAHs: Sediment sampling for 34-PAH dataset

Summary of Findings – ERAWP Desktop Evaluation					
Subarea	Original Screen (SEL)	Original Risk Characterization	Updated Screen (LEL)	Updated Risk Characterization & Rationale	Recommendations

Maintenance-Dynamite West* (MDW)	Hg	<u>Mercury:</u>
		• HQs greater than 1 using NJDEP ESC
		• HQ less than 1 based on lowest NOEC value in Conder et al. (2015)
		• Benthic community survey recommended to provide additional line of evidence
			As, Cu, Pb, PAHs	<u>Arsenic:</u>
				• 95UCL consistent with local background threshold value soil concentrations (see Attachment 1)
				<u>Divalent Metals (Cu, Pb,):</u>
				• AVS/SEM ratios from -36 to 20 (0 of 3 > 130/1300 toxicity thresholds)
				<u>PAHs:</u>
				• 34-PAH datasets unavailable in MDW; conservative approach using 13-PAH dataset and CF
				• ESBTU calculation using 13-PAH dataset (ND@0.5DL):
				  • ESBTUs: 0.73 to 44.4 (n=5)
				• Comparison to CDB 34-PAH ESBTU
				  • 34-PAH ESBTU = 1.0, using same dataset 13-PAH ESBTU = 8.83
				  • 1 of 4 MDW 13-PAH ESBTU > 8, corresponds to location with lowest OC
				Benthic community survey will provide supplemental LoE for all COPECs
					<u>Metals:</u> no further investigation.
					<u>PAHs:</u> conduct full 34 PAH sampling
					Benthic community survey (focused on assessment of Hg per previous recommendations)

Maintenance-NG Ditches (MNG)	Cu, Pb, Hg	<u>Mercury:</u>
		• HQs greater than 1 using NJDEP ESC
		• HQ less than 1 based on lowest NOEC value in Conder et al. (2015)
		• Benthic community survey recommended to provide additional line of evidence
		<u>Divalent Metals (Cu, Pb):</u>
		• AVS/SEM ratios <130 µmol/g
		• No further evaluation recommended
		• Benthic community survey proposed for Hq will provide supplemental LoE
			As, PAHs, Ag, Zn	<u>Arsenic:</u>
				• See attachment re: Arsenic in historic fill as it relates to site concentrations exceeding regional background levels
				• Benthic community survey will provide supplemental LoE
				<u>PAHs:</u>
				• 34-PAH datasets unavailable in MNG; conservative approach using 13-PAH dataset and CF
				• ESBTU calculation using 13-PAH dataset (ND@0.5DL):
				  • ESBTUs: 0.40 to 5.9 (n=3)
				• Comparison to CDB 34-PAH ESBTU
				  • 34-PAH ESBTU = 1.0, using same dataset 13-PAH ESBTU = 8.83
				  • 0 of 3 MNG 13-PAH ESBTU > 8
				• Benthic community survey proposed for Hq will provide supplemental LoE
				<u>Zinc:</u>
				• Divalent metal, previous AVS/SEM data <130umol/g
				<u>Silver:</u>
				• 4/15 detections
				• SD-R2-E-10-1: 8.68 mg/kg (only exceedance of LEL)
				• Benthic community survey will provide supplemental LoE – targeted location near Silver exceedance
					<u>Arsenic:</u> no further investigation
					<u>PAHs:</u> no further investigation
					Benthic community survey (focused on assessment of Hg per previous recommendations)

Misc. TNT Ponds	Pb		As, Hg	Area considered terrestrial, not aquatic	No further evaluation as part of this report

Summary of Findings – ERAWP Desktop Evaluation					
Subarea	Original Screen (SEL)	Original Risk Characterization	Updated Screen (LEL)	Updated Risk Characterization & Rationale	Recommendations

TNT-PETN-NG Ditches* (TPND)	As, Pb, Hg	<u>Mercury:</u>
		• HQs greater than 1 using NJDEP ESC
		• HQ less than 1 based on lowest NOEC value in Conder et al. (2015)
		• Benthic community survey recommended to provide additional line of evidence
		
		<u>Divalent Metal (Pb):</u>
		• AVS/SEM ratios <130 µmol/g
		• No further evaluation recommended
		• Benthic community survey proposed for Hq will provide supplemental LoE
			Cu, PAHs. DNT, Cd	<u>Divalent Metals (Cu, Cd):</u>
				• AVS/SEM ratios <130 µmol/g
				• No further evaluation recommended
				
				<u>PAHs:</u>
				• 34-PAH datasets unavailable in TPND; conservative approach using 13-PAH dataset and CF
				• ESBTU calculation using 13-PAH dataset (ND@0.5DL):
				  • ESBTUs: 0.43 to 4.4 (n=4)
				• Comparison to CDB 34-PAH ESBTU
				  • 34-PAH ESBTU = 1.0, using same dataset 13-PAH ESBTU = 8.83
				  • 0 of 4 TPND 13-PAH ESBTU > 8
				
				<u>Arsenic:</u>
				• See attachment re: Arsenic in historic fill as it relates to site concentrations exceeding regional background levels
				• Benthic community survey will provide supplemental LoE
				<u>DNT:</u> detected in sediment at a single location (0.4 mg/kg)
					<u>Metals:</u> no further investigation.
					<u>PAHs:</u> no further investigation
					
					Benthic community survey (focused on assessment of Hg per previous recommendations)
					<u>DNT:</u> additional evaluation of potential sources conducted, benthic sample will be taken near exceedance

Misc. Offsite Streams – Lower (MOSL)	--		Pb, PAHs	<u>Divalent Metal (Pb):</u>
				• Similar conditions to TPND where AVS/SEM ratios <130 µmol/g
				• AVS/SEM results correlated strongly to OC content
				  • 24/24 samples with OC > 1% yielded result <130 µmol/g
				  • OC content range in MOSL: 0.22 to 43%, average 12.6% (n=58)
				
				<u>PAHs:</u>
				• 13 PAH ESBTU calculation is conservative (95%CF overestimates risk)
				  • CDB 34 PAH ESBTU = 1.0, 13 PAH ESBTU = 8.83
				  • MOSL range: 0.66-25.02 (4 of 5 >1.0, 2 of 5 > CDB 13 PAH benchmark)
					<u>Lead:</u> no further investigation
					
					<u>PAHs:</u> conduct full 34 PAH sampling

Misc. Offsite Streams – Upper (MOSU)	Pb	<u>Divalent Metal (Pb):</u> • 4/5 AVS/SEM ratios <130 µmol/g • 1/5 AVS SEM ratio >130 umol/g and <1300 umol g • At this location, Pb concentration < LEL • No further evaluation recommended	Cu, Hg, As, Ag	<u>Divalent Metal (Cu):</u> • AVS/SEM ratios <130 µmol/g <u>Mercury</u>: • Max detected concentration is ~30% of the lowest NOEC in Conder et al. (2015) <u>Arsenic:</u> • Avg and 95UCL below calculated regional background levels <u>Silver:</u> • 2/21 detections, 1 exceedance of LEL	No further investigation

Summary of Findings – ERAWP Desktop Evaluation					
Subarea	Original Screen (SEL)	Original Risk Characterization	Updated Screen (LEL)	Updated Risk Characterization & Rationale	Recommendations
Central Drainage Basin (CDB)	PAHs, Pb, Hg	<u>Mercury:</u> • HQs greater than 1 using NJDEP ESC • HQ less than 1 based on lowest NOEC value in Conder et al. (2015) • Benthic community survey recommended to provide additional line of evidence <u>Divalent Metals (Pb):</u> • AVS/SEM ratios <130 µmol/g • No further evaluation recommended Benthic community survey proposed for Hq will provide supplemental LoE <u>PAHs</u> • Existing data ESBTU = 1, toxicity unlikely • No further evaluation recommended	As, Cu, Mn, Cd, Zn	<u>Divalent Metals (Cu, Cd, Zn):</u> • AVS/SEM ratios <130 µmol/g (n=11) <u>Arsenic:</u> • Historic fill placed around CDB to support an extensive former railway and road network • See attachment re: Arsenic in historic fill as it relates to site concentrations exceeding regional background levels • Benthic community survey will provide supplemental LoE <u>Manganese:</u> • Small dataset (n=2), single elevated detection (2xSEL), remaining value at LEL • Location of max detect is at former rail crossing culvert/area of historic fill material	**Benthic community survey (focused on assessment of Hg per previous recommendations)**

Note:

* - ESBTU calculated using the 34-PAH dataset = 1

ESBTU - Equilibrium-based Sediment Benchmark Toxicity Unit

Throughout numerous periods of expansion and development, historic fill from multiple local sources was used onsite to increase grade, eliminate shallow ponds/wet areas, improve drainage, increase compatibility of the soils to allow construction of large manufacturing complexes, and establish both narrow gauge and standard gauge rail beds throughout the Facility. Coal combustion byproducts from the local iron foundries made up the majority of historic fill material brought onsite. Historical record confirm that blast furnaces at local foundries burned primarily Anthracite coal (Bayley 1910).

The use of coal combustion byproducts as historic fill, and presence of arsenic in historic fill material is well documented (USGS 2015, NJDEP 2013). USGS (2006) found relatively high arsenic levels in northern Appalachian coal and its combustion byproducts. USEPA (1998) found Anthracite coal to contain arsenic at an average concentration of 8 milligrams per kilogram (mg/kg). NJDEP's historic fill database includes records of arsenic in historic fill samples at over 1,000 milligrams per kilogram.

The SI/RI soil dataset was evaluated to assess potential links between arsenic concentrations onsite and the presence of historic fill material. The following table summarizes a series of datasets representative of areas onsite.

SI/RI Dataset	No. of Samples	Range of Detects	Average	95UCL
Entire Facility	2836	0.707-1150	17.11	NA
Mapped as HF	1079	0.707-1150	26.14	35.95
Not Mapped as HF	1757	0.856-675	11.81	15.53
Local Background	131	1.6-164	7.526	7.335
Regional Background	13	NA	NA	7.32*

Data presented in mg/kg
HF – historic fill
Local and regional background datasets from Hercules (2019)
* - 90th percentile concentration

Arsenic occurs at a range of concentrations within the former manufacturing areas of the Facility with no discernable pattern linking former operations to arsenic concentrations. As illustrated above, arsenic concentrations are higher in areas of historic fill placement, and consistent with local and regional background beyond the footprint of historic fill.

Surface-water drainage pathways onsite cut through areas of historic fill, flow in streambeds confined by historic fill, and discharge through culverts anchored/embedded in historic fill material. These interactions with upland/soil sources, and the influences of erosion, bedload sediment transport, and deposition, appear to be responsible for the presence and distribution of arsenic in Facility sediment. Arsenic in site sediments is likely attributable to historic fill surrounding and within aquatic features.

Doughten et al. (2015) identify pentavalent arsenic (As(V)) as the dominant form in coal combustion byproducts. As(V) is less bioavailable and less toxic than trivalent arsenic (As(III)), and does not readily leach from coal combustion byproducts (USGS 2006, Doughten et al. 2015; Shah et al 2007). Additionally,

reduction of As(V) to the more soluble and toxic As(III) occurs slowly, even in reducing environments, and is readily inhibited by the binding of As(V) while As(III) is rapidly oxidized to As(V) (Brannon 1987, Battelle & Exponent 2000). Arsenic is readily bound by a number of metals, including sulfides and manganese (Nriagu 1994, Battelle & Exponent 2000*).* Manganese is regionally elevated in soils and sediments (Sanders 2003) and is present in sediment onsite. Sulfides are also present across aquatic features onsite and likely serve as a binding complex for divalent metals as well as arsenic. Arsenic is not present above screening standards in surface water in aquatic features onsite, further supporting its presence in sediment in an immobile and insoluble form.

Aquatic ERA Supplemental Sampling Memorandum

27 June 2019

Memorandum

To: Mr. Edward Meeks – Hercules LLC

From: Mr. Scott Larew – Kennedy Jenks Consultants

Subject: Hercules-Kenvil Aquatic ERA Work Plan Addendum
KJ 1540001*60

Background

On behalf of Hercules LLC (Hercules), Kennedy Jenks Consultants (KJ) prepared this technical memorandum summarizing proposed supplemental sampling activities to be completed as part of Aquatic Ecological Risk Assessment (ERA) Work Plan (Work Plan) implementation at the Hercules Kenvil Works Facility, located in Kenvil, Morris County, New Jersey (the Facility). Hercules completed Work Plan field sampling activities in 2017 and presented analytical results and a revised risk characterization in a draft report submitted to the Facility's Licensed Site Remediation Professional (LSRP) in February 2018. Hercules received comments from the LSRP in April 2018. Hercules and the LSRP developed and agreed to responses and resolutions documented in a Screening Summary & Recommendations Package provided March 26, 2019. The recommendations and resolutions therein provide the basis for the methods and locations associated with this supplemental sampling plan.

ERA activities occur as a component of ongoing environmental remediation at the Facility (Program Interest No. 000741) in accordance with New Jersey Administrative Code (N.J.A.C.) 7:26E – New Jersey Department of Environmental Protection (NJDEP) Technical Requirements for Site Remediation (2012), NJDEP Ecological Evaluation Technical Guidance (Version 1.3, February 2015), and United States Environmental Protection Agency (USEPA) Ecological Risk Assessment Guidance for Superfund (2003). The Work Plan was submitted to NJDEP in May 2016 with the Ecological Evaluation/Ecological Risk Assessment (EE/ERA) in the Phase II Remedial Investigation Report (Phase II RIR) (Hercules 2016).

Field Sampling Objectives

Supplemental sampling is proposed in seven subdrainage areas onsite to further evaluate potential risk to benthic macroinvertebrate communities in these areas. In certain areas, this includes additional chemical analyses, while in other areas biological data (invertebrate community composition) will provide an additional line of evidence.

© Kennedy/Jenks Consultants, Inc.

The proposed sampling plan for each subdrainage area is presented in **Table 1**. The following table outlines the COPECs driving sampling and the proposed sample type within each subdrainage area:

Subdrainage Area	COPEC	Sample Type	No. of Locations
Unnamed Ponds	Hg	Benthic community survey, surface water	3
Maintenance Dynamite East	Metals, PAHs	Sediment	3
Maintenance Dynamite West	PAHs, Hg	Benthic community survey, sediment, surface water	2
Maintenance NG Ditches	Hg, Ag	Benthic community survey	2
TNT-PETN-NG Ditches	Hg, DNT	Benthic community survey	3
Misc. Offsite Steams - Lower	PAHs	Sediment	2
Central Drainage Basin	Hg	Benthic community survey	2
Northeast Ponds	--	Benthic community survey (reference location)	2
Development Area Stream	--	Benthic community survey (reference location)	2

Sediment sampling will provide:

- Acid Volatile Sulfide/Simultaneously Extracted Metals (AVS/SEM), pH, grain size, and total organic carbon (TOC) data to evaluate the bioavailability of metals in subdrainage area sediment
- Polycyclic aromatic hydrocarbon (PAH) data (list of 34 parent PAHs and alkylated families) for the calculation of equilibrium partitioning sediment benchmark toxicity units to evaluate the bioavailability and potential toxicity of PAHs in subdrainage area sediment
- Chromium speciation data to evaluate the bioavailability of chromium in subdrainage area sediment

Surface water sampling is proposed in two subdrainage areas and will provide an additional line of evidence regarding the form and bioavailability of mercury (Hg) in these areas.

Benthic community surveys are proposed in five subdrainage areas where risks to benthic communities remains uncertain. Sample locations will be compared to applicable reference locations to help refine understanding of potential risks to benthic invertebrate communities.

© Kennedy/Jenks Consultants, Inc.

Sampling is proposed to take place during summer of 2019 using the methods and locations outlined below.

Field Sampling Methods

Surface Water

Seven surface water samples will be collected from two subdrainage areas, Unnamed Ponds and Maintenance-Dynamite Area - West. Surface water sampling will be conducted in accordance with NJDEP Field Sampling Procedures Manual (FSPM) (NJDEP 2005) and will include surface water sample collection via bottle transfer. Locations will be sampled at six inches above sediment surface. If insufficient water (less than 3 inches), a surface water sample will not be collected. Proposed surface water sample locations are collocated with proposed sediment and/or benthic community samples, and represent locations where methylmercury (MeHg) analysis was proposed in 2017 but not conducted due to an analytical laboratory error (**Figures 1 and 3**).

Surface water sampling locations will be accessed by land working from the most downstream location to upstream and will be collected prior to conducting collocated sampling for benthic community surveys and/or sediment chemistry analyses. A handheld GPS unit will be used to record each sampling location. Horizontal coordinates will be referenced in feet to the North American Datum of 1983 New Jersey State Plane Coordinate System. Prior to sample collection, *in-situ* water quality parameters will be recorded from six inches above the sediment surface at each sample location if standing water is present. *In-situ* parameters include temperature, pH, dissolved oxygen, oxidation-reduction potential, turbidity, conductivity, and salinity. A combination water quality meter will be lowered to the appropriate depth and allowed to equilibrate prior to recording the readings in the field notebook.

Surface water samples will be collected and submitted to Eurofins Lancaster Laboratories Environmental (Eurofins) in Lancaster, PA, a New Jersey Environmental Laboratory Accreditation Program (NJELAP)-accredited laboratory. Surface water samples will be analyzed for total and dissolved MeHg by USEPA Method 1630. The laboratory will prepare “reduced” laboratory data packages as required per N.J.A.C. 7:26E-2.1(a)16.ii.

Sediment Sampling

Seven sediment samples will be collected from three subdrainage areas. Sediment sampling will be conducted in accordance with the current NJDEP FSPM (NJDEP 2005). Samples will be collected from 0-0.5 ft below ground surface after recording in-situ water quality parameters from six inches above the sediment surface at each location where standing water is present. In-situ parameters include temperature, pH, dissolved oxygen, oxidation-reduction potential, turbidity, conductivity, and salinity.

© Kennedy/Jenks Consultants, Inc.

Proposed sediment sample locations were selected based on hydrology and proximity to historical sample locations (**Figures 2, 3, 6**). Sample locations may be relocated by field personnel based on observed environmental conditions (e.g., presence of historic fill material) and will be recorded using a differential global positioning system (GPS) unit.

Sediment samples will be collected by driving polycarbonate tubing to desired collection depth using manual techniques (i.e., rubber mallet). If the polycarbonate tubes do not appear to be collecting adequate sample volume, then other sampling methods may be used (i.e., hand auger, piston core sampler or sample tubes with a check valve attachment). At each sediment sampling location, water depth, sediment core recovery and description will be measured and recorded. A new polycarbonate tube will be used at each sample location.

Sediment samples will be submitted to Eurofins in Lancaster, PA, a NJELAP-accredited laboratory. Sediment samples will be analyzed for pH, grain size, TOC, and PAHs using USEPA Methods 9040C, D422 ASTM, Lloyd Kahn, and 8270SIM, respectively. AVS/SEM and chromium speciation analyses will be conducted in accordance with EPA-821-R-100 and USEPA Methods 6010D and 7196A, respectively. The laboratory will prepare “reduced” laboratory data packages as required per N.J.A.C. 7:26E-2.1(a)16.ii.

Benthic Community Sampling

Benthic community surveys will occur at nine sample locations in five subdrainage areas (**Figures 1, 3, 4, 5, 7**). In addition, two samples will be collected from each of two on-site reference locations in the Development Area and Northeast Ponds (**Figures 8 and 9**). These locations occur near the perimeter of the Facility and represent local, ambient conditions beyond the influence of former Facility operations. Reference sample locations will target similar substrate types and hydrological conditions as the proposed sample locations in the five subdrainage areas.

Sampling technique will be dependent on the type of substrate present at the target sample locations. A Petite Ponar dredge will be used in slow moving or standing water bodies when soft sediment or hard bottom (i.e. sand, clay) substrates are present, and a D-frame dip net will be used in cobble substrate (i.e., riffles and runs) where velocity of water will transport dislodged organisms into the net. Three discrete samples will be collected at each sampling location from the biologically active zone (BAZ) and composited to create a single sample to reduce biases attributable to spatial variability within the sampling area. The area and volume of each sampler used will be recorded such that community metrics can be calculated on a per square meter basis to facilitate comparison.

Samples will be preserved using isopropyl alcohol. Samples will be transferred under chain-of-custody procedures to Normandeau Associates in Stowe, Pennsylvania for identification to the

© Kennedy/Jenks Consultants, Inc.

lowest practicable taxon and enumeration. Normandeau Associates will provide benthic community data in tabular format (*.xls or *.csv).

Schedule and Reporting

Field sampling is targeted for mid/late summer when benthic community diversity and biomass are at/near their peaks. Upon completion of sampling, sediment chemistry data will be combined with the existing datasets (as appropriate) and evaluated in concert with benthic community metrics to update the aquatic risk characterization for the Facility. The evaluation will be presented in an Aquatic Areas Summary Report. The summary report will provide recommendations regarding next steps and risk-based scientific management decision making.

Emily Lynch:

Thank you for your data request regarding rare species information for the above referenced project site.

Searches of the Natural Heritage Database and the Landscape Project (Version 3.4) are based on a representation of the boundaries of your project site in our Geographic Information System (GIS). We make every effort to accurately transfer your project bounds from the map(s) submitted with the Natural Heritage Data Request Form into our GIS. We do not typically verify that your project bounds are accurate or check them against other sources.

We have checked the Landscape Project habitat mapping for occurrences of any rare wildlife species or wildlife habitat on the referenced site. The Natural Heritage Biotics Database was searched for occurrences of rare plant species or ecological communities that may be on the project site. Please refer to Table 1 (attached) to determine if any rare plant species, ecological communities, or rare wildlife species or wildlife habitat are documented on site. A detailed report is provided for each category coded as 'Yes' in Table 1.

We have also checked the Landscape Project habitat mapping for occurrences of rare wildlife species or wildlife habitat in the immediate vicinity (within ¼ mile) of the referenced site. Additionally, the Natural Heritage Biotics Database was checked for occurrences of rare plant species or ecological communities within ¼ mile of the site. Please refer to Table 2 (attached) to determine if any rare plant species, ecological communities, or rare wildlife species or wildlife habitat are

documented within the immediate vicinity of the site. Detailed reports are provided for all categories coded as 'Yes' in Table 2. These reports may include species that have also been documented on the project site.

The Natural Heritage Program reviews its data periodically to identify priority sites for natural diversity in the State. Included as priority sites are some of the State's best habitats for rare and endangered species and ecological communities. Please refer to Tables 1 and 2 (attached) to determine if any priority sites are located on or in the immediate vicinity of the site.

A list of rare plant species and ecological communities that have been documented from the county (or counties), referenced above, can be downloaded from https://nj.gov/dep/parksandforests/natural/heritage/database.html. If suitable habitat is present at the project site, the species in that list have potential to be present.

Status and rank codes used in the tables and lists are defined in EXPLANATION OF CODES USED IN NATURAL HERITAGE REPORTS, which can be downloaded from https://nj.gov/dep/parksandforests/natural/docs/nhpcodes_2010.pdf.

Beginning January 6, 2025, the Natural Heritage Program reports for wildlife species will utilize data from Landscape Project Version 3.4. If you have questions concerning the wildlife records or wildlife species mentioned in this response, we recommend that you visit the interactive web application at the following URL, https://dep.nj.gov/njfw/landscapeapp/, or contact the Division of Fish and Wildlife, Endangered and Nongame Species Program at (609) 292-9400.

Occurrences of Bald Eagle nest and roost habitat have "special concern" rank and are included in Landscape Project Version 3.4. The DEP also recognizes that the U.S. Fish & Wildlife Service maintains additional jurisdiction pursuant to the Bald and Golden Eagle Protection Act (BGEPA). They provide guidance to avoid negative impacts in the "National Bald Eagle Management Guidelines" document found at https://www.fws.gov/sites/default/files/documents/national-bald-eagle-management-guidelines_0.pdf. They also provide a screening tool to help identify activities that may require a Federal permit, at https://www.fws.gov/media/northeast-bald-eagle-project-screening-form.

For occurrences of Osprey nests and other bird nests that persist year to year, active nests continue to be protected from disturbance that can result in "take" (i.e., disturbance that can cause abandonment or loss) pursuant to the NJ Endangered and Nongame Species Conservation Act (ENSCA) and the Federal Migratory Bird Treaty Act. As a result of delisting of Osprey to "stable" conservation status, Osprey nests are not represented in Landscape Project maps, but nest locations are available online at www.Osprey-Watch.org.

For additional information regarding any Federally listed plant or animal species, please contact the U.S. Fish & Wildlife Service, New Jersey Field Office at http://www.fws.gov/northeast/njfieldoffice/endangered/consultation.html.

Information supplied by the Natural Heritage Program summarizes existing data known to the program at the time of the request regarding the biological elements (species and/or ecological communities) or their locations. They should never be regarded as final statements on the elements or areas being considered, nor should they be substituted for on-site surveys required for environmental assessments.

Thank you for consulting the Natural Heritage Program. The attached invoice details the payment due for processing this data request. Feel free to contact us again regarding any future data requests.

Sincerely,

Robert J. Cartica
Administrator

Revisions to Plant Species Nomenclature – September 2024

The scientific names of 48 State Endangered plant species have been updated to reflect currently recognized nomenclature for these species. These species continue to be listed as State Endangered plant species – only the scientific names have been revised.

The nomenclature changes are as follows:

From:	To:
Andromeda polifolia var. glaucophylla	Andromeda polifolia var. latifolia
Aster borealis	Symphyotrichum boreale
Aster praealtus var. praealtus	Symphyotrichum praealtum var. angustior
Aster radula	Eurybia radula
Atriplex subspicata	Atriplex dioica
Botrychium multifidum	Sceptridium multifidum
Carex aquatilis	Carex aquatilis var. substricta
Carex laxiculmis var. copulata	Carex copulata
Chenopodium rubrum	Oxybasis rubra var. rubra
Clitoria mariana	Clitoria mariana var. mariana
Cornus amomum var. schuetzeana	Cornus obliqua
Crataegus succulenta	Crataegus succulenta var. succulenta
Eleocharis compressa	Eleocharis compressa var. compressa
Eriophorum gracile var. gracile	Eriophorum gracile
Gnaphalium helleri var. micradenium	Pseudognaphalium helleri ssp. micradenium
Gnaphalium macounii	Pseudognaphalium macounii
Hieracium kalmii var. fasciculatum	Hieracium umbellatum
Isanthus brachiatus	Trichostema brachiatum
Isoetes melanopoda	Isoetes melanopoda ssp. silvatica
Ledum groenlandicum	Rhododendron groenlandicum
Megalodonta beckii	Bidens beckii
Melanthium virginicum	Veratrum virginicum
Milium effusum	Milium effusum var. cisatlanticum
Muhlenbergia capillaris var. capillaris	Muhlenbergia capillaris
Neobeckia aquatica	Rorippa aquatica
Nuphar microphyllum	Nuphar microphylla

Onosmodium virginianum	Lithospermum virginianum
Ophioglossum vulgatum	Ophioglossum pycnostichum
Oryzopsis pungens	Piptatheropsis pungens
Panicum aciculare	Dichanthelium aciculare
Panicum boreale	Dichanthelium boreale
Panicum dichotomum var. yadkinense	Dichanthelium yadkinense
Panicum hirstii	Dichanthelium hirstii
Panicum longiligulatum	Dichanthelium longiligulatum
Panicum xanthophysum	Dichanthelium xanthophysum
Polemonium reptans	Polemonium reptans var. reptans
Polygonum densiflorum	Persicaria densiflora
Prenanthes racemosa var. racemosa	Nabalus racemosus
Pycnanthemum torrei	Pycnanthemum torreyi
Ranunculus flammula var. filiformis	Ranunculus flammula var. reptans
Rhexia mariana var. ventricosa	Rhexia ventricosa
Schoenoplectus maritimus	Bolboschoenus maritimus
Smallanthus uvedalius	Smallanthus uvedalia
Streptopus lanceolatus	Streptopus lanceolatus var. lanceolatus
Tofieldia racemosa	Triantha racemosa
Trichomanes intricatum	Crepidomanes intricatum
Triosteum angustifolium	Triosteum angustifolium var. angustifolium
Zigadenus leimanthoides	Stenanthium leimanthoides

Attachment 12

Professional Resumes

Scott M. Larew

Principal Ecologist/Vice President

PROFESSIONAL SUMMARY

Scott is KJ's Natural Resource Management Practice Leader and brings 25 years of professional experience in natural resource management, with a strong focus on designing and implementing programs and projects in complex physical and regulatory environments. His ecological assessment, program management, regulatory understanding, and communication skills facilitate regulatory and stakeholder engagement and project success. He has served as a trusted advisor for governmental, industrial, and institutional clients throughout the US.

TOTAL YEARS OF EXPERIENCE
25

EDUCATION
BS, Marine Science/ Biology, Richard Stockton College of New Jersey, 1998

PROJECT EXPERIENCE

Ecological Risk Assessment and Site Remediation, Confidential Client, Northern NJ | *Principal Scientist – Client Service Director*

Leading ecological investigation, risk assessment, and remediation of a 1,100-acre former energetics manufacturing facility. Ecological risk assessment incorporated identification and exclusion of areas of presumed ecological risk to focus quantitative assessment. Led a team of engineers to develop conceptual remedial approaches for the areas of presumed ecological risk, and scope and implement pre-design activities to inform the development of remedial action plans. Coordinated and led regulatory communications related to land use permitting for multiple large remedies. Responsible for technical team leadership, client and regulatory communications, and program coordination.

Ecological Risk Assessment and Tidal Creek Restoration | *Program Manager*

Managed ecological investigation and risk assessment of a tidal creek associated with a former manufactured gas plant site. The risk assessment included a phased field data collection program, the results of which were evaluated in a BERA that reduced the area under consideration for remedial action (e.g., dredging) by more than 50 percent. Data collection included benthic invertebrate and fish community surveys, ecological benchmarking, and sediment toxicity testing. Led a team of ecologists and engineers that collaboratively developed an ecologically-beneficial remedial dredging design that effectively streamlining the permit process and remedial schedule and enhancing the ecological value of the creek. Obtained multiple NJDEP - Division of Land Use Regulation and United States Army Corps of Engineers permits authorizing the dredging and restoration. Valued restoration options using Habitat Equivalency Analysis in anticipation of an NRD settlement. Conducted and coordinated quality assurance oversight during remediation and habitat restoration, and implementation of an ongoing adaptive management program to monitor and maintain the restoration project. Cost: Restoration $650,000, Total $23M

Sediment Investigation and Ecological Risk Assessment, Confidential Industrial Client, Williamsburg, VA | *Principal Scientist*

Lead ecologist on ecological risk assessment of zinc impacts potentially attributable to a former chemical manufacturing facility located on an estuarine creek (secondary tributary to the James River). Responsibilities include design and implementation of field sampling, data reduction and analysis, development of technical content for client/agency briefings, and strategic approach to ecological risk assessment and associated risk management decisions. Investigations involved

collection of sediment for chemical analyses, bioavailability evaluation and benthic community composition. Additional activities include watershed review to select candidate reference creeks and field reconnaissance of candidates to select representative reference habitats.

Biological System Assessment – Southeastern US | *Senior Ecologist*

Performed wildlife and habitat assessment following USEPA's Rapid Bioassessment Protocols (RBP) at a former manufacturing facility and associated aquatic habitats. Efforts spanned the site (~80 hectares), which included 28 miles of creek and floodplain. Activities included soil sampling, electrofishing, terrestrial and benthic invertebrate sampling, habitat characterization, and adjacent land use evaluation. Desktop planning relied on detailed GIS mapping to evaluate ecological systems and adjacent land uses to select field survey locations. Conducted wildlife observations/tracking along 26 miles of creek. Planning involved detailed GIS mapping of historical field data and floodplain transect evaluations. Field surveys included habitat characterization, wildlife tracking, and assessment of terrestrial and aquatic communities.

Habitat Delineation, Assessment and Monitoring | *Environmental Scientist*

Member of ecological field team in multi-decade study of riparian, wetland, and subaquatic habitats along a 40-mile stretch of a major northeastern US waterway. Submerged aquatic vegetation and unconsolidated bottom evaluations incorporated aerial photointerpretation, underwater videography, physical characterization, and benthic quadrat sampling. Performed qualitative assessments of shoreline habitats, including delineation and sampling. Currently conducting post-restoration monitoring to evaluate the success of natural recruitment and active restoration areas.

Remedial Investigation/Ecological Risk Assessment, Confidential Client, Confidential Superfund Site (USEPA Region 2) | *Senior Scientist*

Managed development and implementation of a field sampling program in support of a comprehensive remedial investigation (RI) at a former paper mill site. Program implementation required coordination with state and federal agencies during preparation of land use permit equivalency applications for various activities including installation of soil borings, demolition of structures, and regrading and restoration of disturbed areas of the site. Responsible for regulatory compliance and ecological restoration elements of a large remedial action indirectly resulting from the RI implementation and risk assessment results. Responsibilities included identification and contracting of suppliers, and working with construction management to balance construction sequencing for purposes of regulatory compliance and cost control.

Remedial Investigation/Ecological Risk Assessment/Feasibility Study, Georgia-Pacific Wood Products, LLC, Hardwood Sawmill Sites, NC | *Senior Scientist*

Managed ecological risk assessments for two hardwood sawmill sites, specifically addressing the sites' potential impacts to adjacent surface water bodies. Led the design and implementation of ecological field studies on the sites and in adjacent water bodies. Coordinated with regulatory agencies, adjacent property owners and town officials. Contribute technical and financial information as part of the client's decision framework related to future site uses, remedial strategy and path to closure. Developed remedial action plans for both sites, coordinated with the state agency through the public participation and approval processes. Currently managing implementation of the remedial action plans and closure of the sites.

Amanda Emert

Environmental Toxicologist (Risk Assessment Scientist)

PROFESSIONAL SUMMARY

Amanda is an environmental toxicologist specializing in ecological and human health risk assessment. Her work has involved synthesizing animal, epidemiological, and mechanistic evidence, performing Benchmark Dose (BMD) modeling, and developing toxicity and risk assessment strategies. Previously, as a Graduate Research Assistant at Texas Tech University, Amanda conducted deterministic and probabilistic ecological risk and human health assessments, developed procedural guidance for risk assessment methodology under the USEPA FIFRA regulatory framework, and performed multimedia sampling and analyses. She has also provided technical guidance on EPA analytical applications and supervised field labs and projects.

PROJECT EXPERIENCE

Ecological Risk Assessment, Confidential Client, NJ | *Risk Assessment Scientist*

Providing ecological investigation and risk assessment support of a 1,100-acre former energetics manufacturing facility. Ecological risk assessment incorporated identification and exclusion of areas of presumed ecological risk to focus quantitative assessment.

Ecological Risk Assessment, Confidential Client, NJ | *Risk Assessment Scientist*

Providing ecological investigation and risk assessment support for a Facility under the oversight of New Jersey Department of Environmental Protection (NJDEP) Contaminated Site Remediation and Redevelopment (CSRR) Program. Updated historical risk characterization of metals in wetland sediment and presented field and analytical data focused on metals delineation in sediment.

Preliminary Assessment, Confidential Client, NJ | *Risk Assessment Scientist*

Prepared a Preliminary Assessment Report (PAR) for a Superfund site under NJDEP oversight in accordance with the NJDEP Green Acres Program. The PAR is supportive of the Natural Resource Damages settlement agreement process currently underway for a portion of the Site.

Human Health Risk Assessment, Confidential Client, PR | *Risk Assessment Scientist*

Performs quarterly human health risk reviews of contaminants of potential concern (COPCs) in groundwater for monitoring wells included in the long-term monitoring program.

Technical Support, NJ | *Staff Scientist*

Prepared Technical Memorandum request for a Technical Review Panel for a Facility under the oversight of the NJDEP Contaminated Site Remediation & Redevelopment (CSRR). Chronicled site investigation and remedial actions of multiple entities, resolution efforts, and technical bases for client position of items under dispute.

Phase II Site Assessment, Washington State Department of Ecology, WA | *Staff Scientist*

Prepared a Sampling and Analysis Plan/Quality Assurance Project Plan and Phase II Environmental Site Assessment (ESA). This Phase II ESA incorporated multiple environmental

media (i.e. surface water, sediment, surface and shallow soil, subsurface soil, and groundwater), with specific focus on metals and PFAS contamination.

PREVIOUS RELEVANT EXPERIENCE

Goldbelt Apex, LLC. (supporting Defense Centers for Public Health – Aberdeen) | *Toxicologist*

Led development of perfluorooctane sulfonic acid (PFOS) hazard assessment and supported development of perfluorooctanoic acid (PFOA) hazard assessment in support of partners project by the Defense Health Agency and Veterans Health Administration. Performed literature reviews, characterized dose-response information, and provided clear and accurate synopses. Synthesized animal, epidemiological, and mechanistic evidence of PFOS toxicity to system endpoints, integrating these lines of evidence to develop points of departure. Performed BMD modeling using EPA software and conducted study evaluations with the Health Assessment Workspace Collaborative (HAWC) system. Coordinated with DCPH-A TOX directorate on Population, Exposure, Comparator, and Outcome (PECO) statement and strategy development and provided timely summary reports and presentations to interagency leadership for interim review.

Texas Tech Institute of Environmental and Human Health | *Graduate Research Assistant*

Designed and implemented ecological risk and human health assessments and environmental justice analyses for agroecosystems and isolated wetlands adhering to EPA Office of Pollution Prevention SOPs. Developed procedural guidance and policy recommendations pertinent to CWA, CAA, CERCLA, EPCRA, and FIFRA for assessments supporting pesticide registration and CAFO risk evaluation. Conducted multimedia sampling and analyses of agrochemicals. Provided technical guidance on EPA analytical application, methodology, and QA/QC procedures for analyses of metals in biological tissue; supervised acid digestions. Performed amphibian and aquatic invertebrate surveys, wetland habitat quality assessments, aboveground biomass surveys, and small mammal community surveys.

Daniel B. Stephens & Associates, Inc. | *Project Assistant II*

Drafted technical reports, scope of work, and line-item subcontractor budgets under direct supervision of senior staff for TCEQ-managed LPST, DCRP, and CERCLA program sites primarily in Phase II, assisting with Phase I due diligence, as needed. Performed data entry and QA/QC of NELAC-accredited groundwater and soil analytical reports. Provided client and subcontractor billing and administrative support.
